NAME P/N C/I	CR#	FAILURE MODE & CAUSES	FAILURE EFFECT	RATIONALE FOR ACCEPTANCE																			
RELIEF VALVE ITEM 693 39792098-3 612	1/1	6931H03; External gas leakage.	EMD ITEM: Relief valve fails to seal to ambient (relief).	A. Design - Relief valve: There are two seals in the relief valve that separate vent loop gas from ambient; one is a conventional static silicone O-ring which creates a seal by maintaining a controlled squeeze on the elastomer. Precise dimensions and surface finish and lip control help maintain sealing performance. Cause: Relief failure, post contamination. Reduced ability to pressurize coil. More frequent 02 actuator cycles required to maintain P.S.I.D. coil coil pressure. Rationale: Reduced bonds Treatment capability. Catastrophe: Possible loss of crewman from decompression sickness if leak is severe enough to completely lose pressurization capability.	<p>The second seal is formed by the valve lip seating on a silicone ring. Valve geometry and clearances are controlled to permit lip to elastomer alignment under all tolerance conditions. Also, the depth of indentation is controlled to form a seal but prevent elastomer overtravel. This self aligning, light indentation and lip to elastomer relationship, creates a reliable valve seal.</p> <p>Contamination: An Inlet Filter protects the valve from particles greater than 0.006 inch. The valve seal, consisting of a sharp lip contacting an elastomeric seal, can accept tiny particles in this range and maintain a seal.</p> <p>B. Test - Component Acceptance Test - The item is external leakage tested per vendor test sheet to 7.9-8.04 psi where a maximum leakage of 25.0 sec/min 02 is allowed.</p> <p>PSS Test - An external leakage test is performed per SEMU-80-018, to 7.9-8.04 psi where a maximum leakage of 15.0 sec/min 02 is allowed.</p> <p>Certification Test - The RIA completed the following Certification Cycles in 9/90:</p> <table> <thead> <tr> <th>Test</th> <th>Actual Cycles</th> <th>Spec. Cycles</th> </tr> </thead> <tbody> <tr> <td>Proof Press. (13.3 psi)</td> <td>16</td> <td>16</td> </tr> <tr> <td>Crack/Rew. Flow</td> <td>2100</td> <td>2100</td> </tr> <tr> <td>Halt/Bonnet</td> <td>500 Hatch Seal</td> <td>500 Hatch Seal</td> </tr> <tr> <td>Poppet Keeper Retraction</td> <td>312</td> <td>312</td> </tr> <tr> <td>Burst Press. (32.2 psi)</td> <td>1</td> <td>1</td> </tr> </tbody> </table>	Test	Actual Cycles	Spec. Cycles	Proof Press. (13.3 psi)	16	16	Crack/Rew. FAILURE EFFECT

BARRIERS FOR ACCEPTANCE

The BIA assembly completed the 15-year random vibration (45 minutes per axis), sinusoidal vibration, design and bench shock testing in 9/89.

C. Inspection -

All O-seals, seating surfaces, valve seat, and poppet sealing surfaces are 100% inspected for dimensional and surface finish requirements. All parts are cleaned to level GM1500 per GMW3150 prior to assembly.

D. Failure History -

R-EMU-Q93-CBDF (10/30/87) excessive external leakage due to contamination from the test facility. A 2 micron filter was added to the test facility.

E. Ground Turnaround -

Tested for external leakage per FEMU-R-001.

F. Operational Use -

Crash Response -

For minor leaks, cycle the O2 actuator more frequently to obtain transient conditions. For greater leaks,градите leak problems.

Consider IVM to close relief valve and use helium purge valve to control bulk pressure.

Training -

Standard EMU training covers this failure mode.

Operational Consideration -

Not applicable.
