<p>TVC/MLA does not respond to any command via the A7 panel or the uplink.</p> <p><b>EYC</b></p> <p>A1 - Command Detector. Sync Stripper. Clock Divider Chain. Sync Generator. 2294880-504</p> <p>A2 - Command Decode Logic Command Execution Logic Location Code Logic Camera Timing Logic 2294881-501</p> <p>A4 - Sync/Cmd Rcvr 2294884-503</p> <p>A5 - Automatic Light Control 2294883-505</p> <p>A6 - Power On/Off Switching. Input Voltage Preregulator. Output Voltage Regulators. 229488-501</p> <p>A7 - DC-DC Converter Primary Oscillator/Driver. Secondary Rectifiers/Filters 2294886-503</p> <p>A13 -Master Oscillator.</p>	<p>(1) No lens motion, i.e., focus, zoom, or iris.</p> <p>(2) Unable to change SLC of GAMMA mode.</p> <p>Worst Case: Loss of mission critical video.</p>	<p><b>DESIGN FEATURES</b></p> <p>The TVC/Lens Assembly is comprised of 16 electrical subassemblies; 13 subassemblies are RCA Astro designed and fabricated using standard printed-circuit board type of construction. The remaining three assemblies, high voltage power supply, oscillator, and stepper motors, are vendor supplied components which have been specified and purchased according to RCA Specification Control Drawings (SCDs) prepared by engineering and reliability assurance. Specifications per the SCD are prepared to establish the design, performance, test, qualification, and acceptance requirements for a procured piece of equipment.</p> <p>Parts, materials, processes, and design guidelines for the Shuttle CCTV program are specified in accordance with RCA 2295503. This document defines the program requirements for selection and control of EEE parts. To the maximum extent, and consistent with availability, all parts have been selected from military specifications at the JAN level, as a minimum. In addition to the overall selection criteria, a subset of general purpose preferred parts has been defined by this document and the RCA Government Systems Division Standard Parts List. In the case of the CMOS and TTL family of microcircuits, devices are screened and tested to the MIL-STD-883C equivalent and procured under the designations of ME-REL/3WJ and SNC 54LS from RCA-550 and Texas Instruments Corp, respectively. Parts not included in the above documents have been used in the design only after a nonstandard item approval form (NSIAF) has been prepared, submitted to Reliability Assurance Engineering (RAE) and approved for use in the specific application(s) defined in the NSIAF by NASA-JSC.</p> <p>Worst-Case Circuit Analyses have been performed and documented for all circuit designs to demonstrate that sufficient operating margins exist for all operating conditions. The analysis was worst case-in that the value for each of the variable parameters was set to limits that will drive the output to a maximum (or minimum).</p> <p>A component application review and analysis was conducted to verify that the applied stress on each piece part by the temperature extremes identified with environmental qualification testing does not exceed the stress derating values identified in RCA 2295503.</p> <p>In addition, an objective examination of the design was performed through a PDR and CDR to verify that the TVC/Lens assembly met specification and contractual requirements.</p>

Circuit connections are made through printed traces which run from point to point on the board surfaces. Every trace terminates at an annular ring. The annular ring surrounds the hole in which a component lead or terminal is located. This ring provides a footing for the solder, ensuring good mechanical and electrical performance. Its size and shape are governed by MIL-P-55640 as are trace widths, spacing and routing. These requirements are reiterated specifically in drawing notes to further assure compliance. Variations between the artwork master and the final product (due to irregularities of the etching process) are also controlled by drawing notes. This prevents making defective boards from good artwork. Holes which house no lead or terminal, but serve only to electrically interconnect the different board layers, contain stitch bars for mechanical support and increased reliability.</p> <p>The three holes are drilled from a drill tape thus eliminating the possibility of human error and allowing tight control over hole and annular ring concentricity, an important reliability criterion. After drilling and etching, All copper cladding is tin-lead plated per MIL-STD-1495. This provides for easy and reliable soldering at the time of board assembly, even after periods of prolonged storage.</p> <p><b>BOARD ASSEMBLY DESIGN (A1, A4, A5, A6, A7)</b></p> <p>All components are installed in a manner which assures maximum reliability. Component leads are pre-tinned, allowing total wetting of solder joints. All leads are formed to provide stress relief and the bodies of large components are staked. Special mounting and handling instructions are included in each drawing required after final assembly. The board is coated with urethane which protects against humidity and contamination.</p>

<p>TYC/MLA does not respond to any command via the A7 panel or the uplink.</p> <p>TYC</p> <p>A1 - Command Detector. Sync Stripper. Clock Divider Chain. Sync Generator. 2294880-504</p> <p>A2 - Command Decode Logic Command Execution Logic Location Code Logic Camera Timing Logic 2294881-501</p> <p>A4 - Sync/End Rcvr 2294884-503</p> <p>A5 - Automatic Light Control 2294883-505</p> <p>A6 - Power On/Off Switching. Input Voltage Preregulator. Output Voltage Regulators. 229488-501</p> <p>A7 - DC-DC Converter Primary Oscillator/Driver. Secondary Rectifiers/Filters 2294886-583</p> <p>A13 - Master Oscillator.</p>	<p>(1) No lens motion, i.e., focus, zoom, or iris.</p> <p>(2) Unable to change ALC or GAMMA mode.</p> <p>Worst Case: Loss of mission critical video.</p>	<p><b>DESIGN FEATURES</b></p> <p><b>BARE BOARD CONSTRUCTION (A2)</b></p> <p>The boards are of "welded wire" construction. At the bare board level this does not distinguish it from a normal PC board except that holes which will take weld pins generally are not connected to PC traces. Only those pins which bring power and ground potentials to the ICs are on PCs. An annular ring surrounds the hole in the board where each power and ground pin is located. These pins are then soldered to the trace like any other component lead. Aside from this feature, all design &amp; construction techniques used in PC board layout apply.</p> <p><b>BOARD ASSEMBLY (A2)</b></p> <p>The drilled and etched board is populated with several hundred solderable or weldable pins. Power and ground pins, as well as connector pins, are soldered in place. Discrete components (resistors, diodes, capacitors) are attached to bifurcated terminals, where they are soldered. Flatpack ICs are welded, lead-by-lead, to the tops of the weld pins. After welding, extra lead material is trimmed away. Circuit connections are made using #30 AWG nickel weld wire. The wire is welded to the pin surfaces on the board backside. All wire welds are done using a machine which is tape driven, thus eliminating the possibility of miswiring due to operator error. All wiring &amp; circuit performance is tested prior to box-level installation. After successful testing, components are staked as required by drawing notes and the assembly is coated with urethane.</p> <p>The board is inserted in the box on card-edge guides, in the same manner as the other PC boards.</p> <p><b>BOARD PLACEMENT</b></p> <p>The A1, A2, A4, A5, A6, board is secured in the electronics assembly by gold-plated beryllium copper card guides. Connections are made to the mother board with blind-mated connectors. Disengagement during launch is prevented by a cover which spans the board's free edge.</p> <p>The A7-A low voltage power supply board is bolted in place at 6 points around its perimeter. Four of these mounting screws also pass through and tie down the smaller A7-B board. These two boards are mounted face-to-face, separated by the standoffs. Electrical interconnections are achieved by jumper wires between the two boards. The A7-A houses a 34-pin connector which brings in power and signals from outside the module.</p> <p>The A7 module includes these two boards as well as power transistor Q4. The module housing is heat aluminum sheet, comprised of two halves screwed together. The boards and Q4 are secured to the lower half, and wired together. Then the upper half is put in place. By mounting Q4 directly to the aluminum housing, good thermal performance is assured.</p>
