PREFACE

This volume is the fourth in a series of reference works intended to present a statistical summary of the activity of the National Aeronautics and Space Administration from its inception. Volume IV, *NASA Resources 1969–1978*, is an update of the initial volume in the series, *NASA Resources 1958–1968*. The present volume treats briefly, as did its predecessor, NASA's history, organization, management, financing, personnel, and procurement matters during the second decade of its existence. Its primary objective is to provide the reader with comprehensive statistical data to illustrate the status of NASA in the decade after the first man set foot on the Moon.

Volume IV is organized in the same way as the first volume. Each chapter of the present volume deals with the same subject matter as the first one. There are some differences, however. Whereas the first volume provided statistical data not only for the individual installations but also for each installation's component facilities as well, this volume combines statistical data of the component facilities with the data of the parent installation. There are two reasons for this. First, many of the component facilities were consolidated with their parent installation between 1969 and 1978. Second, increasingly during this decade NASA offices themselves tended to consolidate all statistical data on the particular installation. The statistical tables in this volume contain some gaps simply because the prerequisite data were not available. Finally, until 1976 the fiscal year began in July and ended at the end of June. Starting October 1976, it began in October and ended at the end of September. Whenever information was available, data were provided for the so-called "transition quarter" (TQ) to cover the period July 1, 1976, to September 30, 1976. Otherwise, the transitional quarter is combined with 1976.

The author wishes to acknowledge the contributions of numerous individuals to this volume. The author expresses his gratitude to Dr. Roger D. Launius, the Chief Historian of NASA's History Division, Lee D. Saegesser of NASA's History Division, and others at NASA who contributed their guidance, extensive knowledge, and research materials. He is particularly grateful to his colleague, Helen Fedor, who worked with him on this project formatting the large number of tables in this volume and entering the data into them. Special thanks are owed David P. Cabitto, who designed the artwork on the title page of each chapter and oversaw the preparation of the map and graphic work. Finally, the author is especially grateful to Andrea T. Merrill for her diligence in the editing and preparation of the manuscript.

CHAPTER ONE

INTRODUCTION

CHAPTER ONE

INTRODUCTION

As the 1960s came to a close, NASA could proudly look back at the past decade as one of significant achievements and triumphs. In a relatively short span of time, NASA's great feats in space exploration had allowed the United States to pass the Soviet Union as the unquestioned leader in this endeavor. A decade of spectacular space voyages had been crowned on July 20, 1969, when NASA landed the first human on the moon. NASA hoped that in the next decade the agency would accomplish new and equally spectacular achievements in space exploration. The proposed program of space exploration for the next two decades, submitted to the President in 1969 by the Space Task Group chaired by Vice President Spiro T. Agnew, delineated such projects as a Mars manned mission, a lunar surface base, a lunar orbital space station, an earth orbital space station, and reusable space shuttles.

Paradoxically, it was at this moment of NASA's great triumphs that the tide of public opinion began to turn. NASA's very success—catching up to and overtaking the Soviet space program—dulled the public's appetite for new sensational feats in space. Furthermore, the increasingly unpopular war in Vietnam fully preoccupied the public's attention, placed a heavy burden on the nation's economy, strained the Government budget, and generated a host of domestic problems. NASA's annual budget, which had reached more than \$5 billion in the mid-1960s and stood at almost \$4 billion in 1969, was reduced to \$3.7 billion in 1970 and just over \$3 billion in 1974.

The cuts in the NASA budget had a considerable impact on the agency. Grandiose space programs were eschewed in favor of more modest and, from the public's point of view, practical programs. Thus, of the programs suggested in 1969 by the Space Task Group, only the development of the Space Shuttle was approved, in 1972. And the approved Space Shuttle project was a more economical and scaled down version than the one originally envisioned by NASA. Funds appropriated for research and development were reduced, not only because of cuts in the overall NASA budget but also because an increasing share of NASA funds went for administrative operations. In 1969 almost \$3.4 billion was appropriated for research and development. In 1974 the figure fell to a low of \$2.2 billion, rising again to slightly over \$3 billion in 1978.

Cuts in the NASA budget had an impact on the growth and development of the individual NASA installations as well. Although one could hardly have expected the extensive growth and expansion of NASA facilities during 1958-68 to continue into the next decade, some expansion of NASA facilities likely would have occurred if NASA's budget had not been cut. As it was, NASA underwent a process of consolidation and reduction of its facilities during 1969-78. The best examples of this were the closing of the Electronics Research Center as a NASA installation in 1970 and the transfer of its facilities to the Department of Transportation and also the disestablishment of the Space Nuclear Systems Office in 1973.

The change in the nature and emphasis of research and development carried out by NASA during the second decade of its existence was reflected in the quantity and composition of its personnel. Between 1969 and 1978, the number of NASA in-house employees was reduced by almost 10,000, or by about a third of what it was in 1969. The reduced work force contained, however, an increasingly large percentage of scientists and engineers and other personnel with professional degrees. In addition, there was a marked increase during this period in the number of minority employees at NASA. Minority employees made particularly impressive gains among NASA's professional administrative ranks. There was also a slight increase in the percentage of women employed by NASA during the 1969-78 period. Like minority employees, women achieved their greatest gains in professional administrative positions.

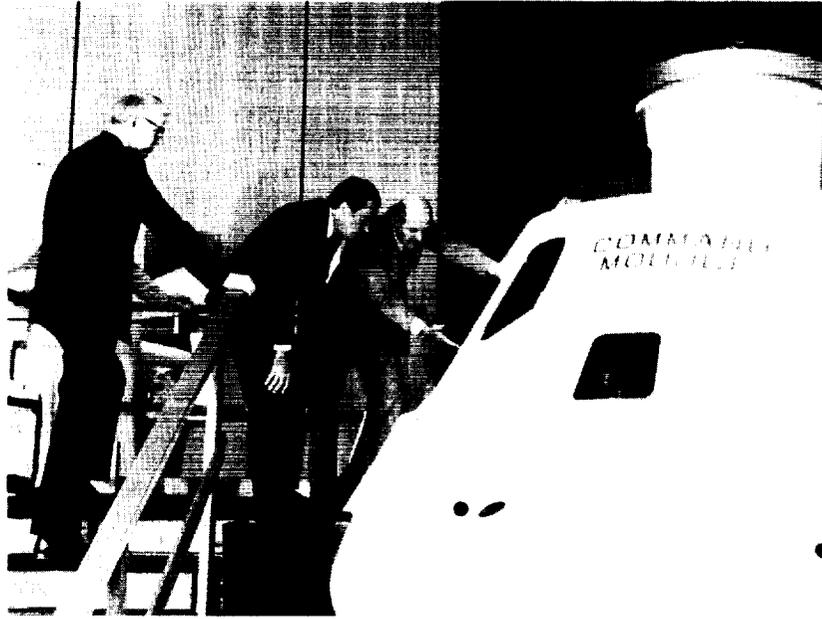

In spite of the considerable cuts in its funding and personnel, during the 1969-78 decade NASA continued to push forward in space exploration and to make important advances in the development of spacecraft technology. Many of the NASA projects that were begun during the previous decades endured into the 1970s. Apollo lunar exploration continued until December 1972 with the launching of Apollo 17, the last flight of the Apollo Moon program. The Mariner space probes to Mars in 1969 and 1971 were followed by the Mariner probe of the planet Mercury in 1974. In 1972 Pioneer 10 began its successful year and one-half journey to the planet Jupiter. Pioneer 11 repeated the journey in 1973 and then flew toward the planet Saturn. A Viking probe of Mars in 1976 was followed by a Voyager flight to Jupiter in 1977 and a Pioneer probe of Venus in 1978. These and other flights to the planets of our solar system marked a period of intensive study of the planets in search of knowledge that could explain the mysteries of the earth itself.

Concurrently with the exploration of the planets, NASA was pursuing programs that had tangible and immediate impact on earth-related problems. In the 1970s, a number of satellites were launched into orbit around the earth. These satellites, such as the Earth Resources Technology Satellite launched in July 1972, scanned the earth and provided real-time information on such topics as crop inventory and crop health, water storage, air and water pollution, forest diseases and forest fires, and coastal and oceanic movements. Although unmanned satellites performed the bulk of research in space, manned space flight was not neglected. Instead of sending astro-

nauts on a distant journey to the planets, however, NASA's Skylab project called for them to live and perform experiments in a space laboratory orbiting around the earth. The Skylab, a space workshop, was launched by a Saturn V rocket and placed into an earth orbit in May 1973. Eleven days later, a manned Apollo command and service module combination was launched into orbit by another Saturn rocket and docked with the workshop. The first crew spent twenty-eight days aboard the Skylab, proving that humans could live and work in space. Two other missions followed in 1973.

Increasingly, the satellites put into orbit by NASA during this period were performing research and experiments for other Government agencies, private corporations, and even foreign governments. The increased cooperation in space exploration between the United States and other countries led to one of the more striking feats in space. In July 1975, the United States and the Soviet Union carried out a joint space venture, the Apollo-Soyuz Test Project, when an orbiting Soviet Soyuz spacecraft rendezvoused and docked with a American Apollo spacecraft. The two spacecraft then proceeded to exchange crews and conduct joint experiments.

In its second decade of existence, from 1969 to 1978, NASA achieved notable successes. After the enormous achievement of landing a man on the Moon in 1969, NASA went on to other missions, including sending space probes to explore other planets in our solar system, orbiting satellites to study the earth, establishing an orbiting space laboratory, and performing space exploration jointly with other countries. As the next decade dawned, NASA was embarking on new ventures, chief among them the Space Shuttle program, to fulfill its commitment to maintaining United States leadership in space exploration.

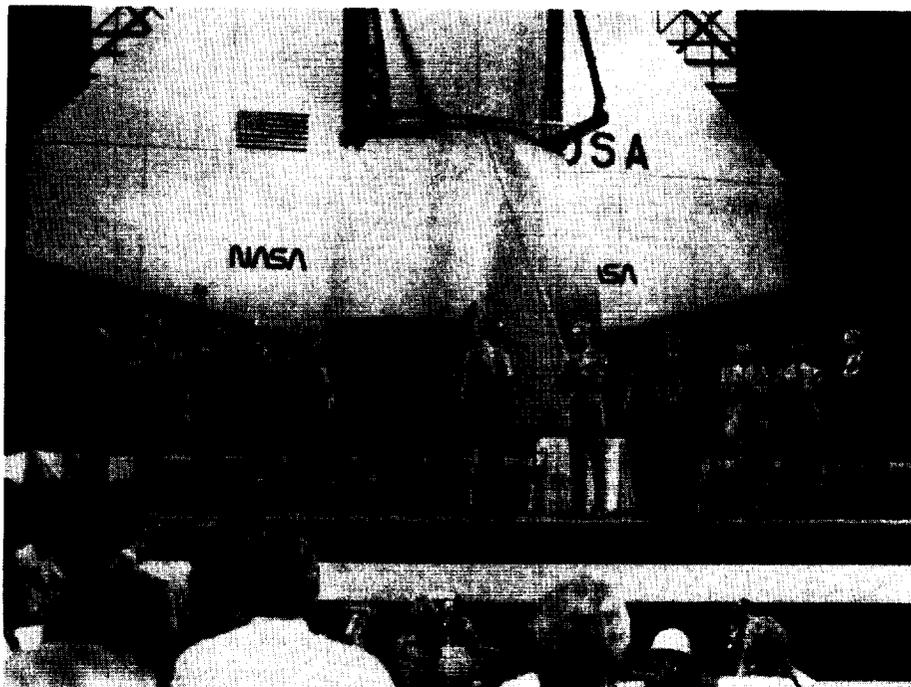

President Richard M. Nixon being briefed by Flight Commander, Astronaut Thomas P. Stafford on the Apollo Command Module to be used in the U.S.-U.S.S.R. Apollo-Soyuz flight in the summer of 1975. Standing at the President's right is Dr. James C. Fletcher, NASA Administrator.

CHAPTER TWO

NASA FACILITIES

For NASA facilities, the first decade of NASA's existence was a period of rapid growth and expansion. The basic configuration of NASA installations was developed from 1958 to 1968. By the end of FY 1968, there were ten NASA field installations, each with its own Director. They were the Ames Research Center (ARC) at Moffett Field, California; the Electronics Research Center (ERC) in Cambridge, Massachusetts; the Flight Research Center (FRC) at Edwards Air Force Base, California; the Goddard Space Flight Center (GSFC) in Greenbelt, Maryland; the John F. Kennedy Space Center (KSC) near Cape Canaveral, Florida; the Langley Research Center (LaRC) at Langley Field in Hampton, Virginia; the Lewis Research Center (LeRC) in Cleveland, Ohio; the Manned Spacecraft Center (MSC) near Houston, Texas; the George C. Marshall Space Flight Center (MSFC) in Huntsville, Alabama; and the Wallops Station (WS) on Wallops Island, Virginia. In addition, the Jet Propulsion Laboratory (JPL), operated in Government-owned facilities in Pasadena by the California Institute of Technology, has been under contract to NASA since 1959. Another NASA installation, the Space Nuclear Propulsion Office (SNPO) in Germantown, Maryland, with branch offices in New Mexico, Ohio, and Nevada, reported directly to the NASA Headquarters Office of Advanced Research and Technology. Also, several of the independent NASA centers had component installations.

The second decade of NASA's existence was for the most part a period of retrenchment for its facilities. The Electronics Research Center closed as a NASA installation on June 30, 1970, and its facilities were transferred to the Department of Transportation. Also that year, the Space Nuclear Propulsion Office was renamed the Space Nuclear Systems Office. It was disestablished in 1973. The Manned Spacecraft Center was renamed the Lyndon B. Johnson Space Center (JSC) on February 17, 1973. On April 14, 1974, Wallops Station was renamed the Wallops Flight Center (WFC), reflecting its expanded use as a rocket flight-test range. The same year, on June 14, 1974, the Mississippi Test Facility at Bay St. Louis, Mississippi, one of the component installations of the Marshall Space Flight Center, was established as an independent NASA field installation and renamed the National Space Technology Laboratories (NSTL). On January 8, 1976,

the Flight Research Center was renamed the Hugh L. Dryden Flight Research Center (DFRC) in honor of the first NASA Deputy Director, who was an aeronautical research pioneer.

Whereas the first decade of NASA's existence witnessed a rapid growth in the number and size of its facilities, a comparable expansion did not take place in the second decade. Indeed, as indicated by Tables 2-1 to 2-30, the most remarkable characteristic of NASA's field installations during the second decade of NASA's existence was the lack of any significant changes. From 1959 to 1968, the land area on which NASA installations were located grew from 5,179 acres to over 142,000 acres. By 1978 the number of acres had actually decreased to just slightly over 136,000 acres. The total real property value grew from just over \$268 million in 1959 to \$2.4 billion in 1968; in 1978 it stood at \$2.8 billion. The total investment value of NASA installations—comprising real property, leasehold improvements, capitalized equipment, and fixed assets-in-progress—rose from \$4.4 billion in 1968 to \$6 billion in 1978. From 1968 to 1978, investment value rose only modestly in three of the above categories but showed a marked increase in capitalized equipment value from \$1.4 billion in 1968 to \$2.9 billion in 1978.

Attainment of stability in the NASA system of installations is further evidenced by comparing proportional changes that make up the total real property value. Whereas the value of buildings changed from almost 92 percent of the total in 1959 to close to 54 percent in 1968, it remained almost steady during the next decade, rising to only slightly less than 56 percent in 1978. Similarly, the value of other structures and facilities rose from about 8 percent of the total in 1959 to almost 42 percent in 1968, and in the next decade it changed by only 2 percent, attaining the figure of 40 percent in 1978. The value of NASA-owned land was 0.3 percent of the total in 1959, 4.3 percent in 1968, and 4.1 percent of the total real property value in 1978.

Definition of Terms

Definitions of the terms used in this chapter were taken from NASA Management Instructions (NMIs) and NASA Handbook (NHB) *Approval of Facility Projects*.¹

Buildings. Facilities with the basic function of enclosing usable space. This category of real property includes buildings leased by or on behalf of NASA and improvements to NASA-owned buildings and installed property but excludes leasehold improvements (NMI 8800.1A).

Note: In the tables of this chapter and those of Chapter Six, the square footage of buildings leased does not include GSA-leased buildings.

¹NASA, Office of Organization and Management, Administrative Services Division, NASA Management Instruction (NMI) 8800.1A and 1132.2A; and NASA Handbook (NHB) 7330.1, *Approval of Facility Projects*.

Component Installation. An installation, office, or other NASA organizational element that is located geographically apart from a NASA installation and that, pursuant to delegations from the Administrator, is assigned for management purposes to the Official-in-Charge of a Headquarters office, the Director of a field installation, or an immediate subordinate of these officials (NMI 1132.2A).

Component installations of NASA Headquarters include:

NASA Pasadena Office

The Space Nuclear Propulsion Office/Space Nuclear Systems Office was organizationally under the NASA Headquarters Office of Advanced Research and Technology and in some cases was regarded as a component installation.

Former component installations of NASA Headquarters include:

NASA Daytona Beach Operation

NASA Office—Downey

North Eastern Office

Western Coordination Office

Western Operations Office

Western Support Office

Component installations of centers include:

Kennedy Space Center—Western Test Range Operations Division

Lewis Research Center—Plum Brook Station

Manned Spacecraft Center—White Sands Test Facility

Marshall Space Flight Center—Michoud Assembly Facility with its Computer Operations Office; Mississippi Test Facility (until June 14, 1974, when it became the independent National Space Technology Laboratories); and Slidell Computer Facility

Easement. An acquired privilege or right of use or enjoyment that one party may have in the land of another, for example, an easement or right-of-way for road or highway purposes or for construction and maintenance of utility lines (NHB 7330.1, 26).

Equipment. Personal property that meets all of the following criteria: (a) has an estimated service life of one year or more, (b) has an initial acquisition cost of \$50 or more per unit, (c) retains its identity when put into use, and (d) will not be consumed during an experiment (NHB 7330.1, 26-27).

Collateral Equipment. All nonintegral, severable equipment that is acquired for use, or is used, in a facility. Collateral equipment is not required to make the structure or building useful and operable as a structure or building, but it imparts to the facility its particular character at the time, for example, furniture in an office building or test equipment in a test stand (NHB 7330.1, 25). See Personal Property.

Integral Equipment. Equipment that is normally required to make a facility useful and operable as a facility and that is built in or permanently affixed to it in such a manner that removal would impair the usefulness, safety, or comfort of the facility. Integral equipment includes such items

as elevators, central air-conditioning systems, and electrical and plumbing fixtures and equipment (NHB 7330.1, 28). See Installed Property.

Note: As used in this chapter and in Chapter Six, equipment refers to capitalized equipment only. (To be recorded as capitalized equipment, the equipment must have an estimated service life of more than one year, be identifiable as equipment when in use and not part of other equipment, generally cost \$200 or more, and not be intended to be consumed in an experiment. Noncapitalized equipment is charged to the appropriate cost account as "expensed equipment."²)

Facility. A generic term used to encompass real property and related integral and collateral equipment of a capital nature; thus the term does not encompass operating materials, supplies, and noncapitalized equipment. The term "facility" is used in connection with land, buildings (facilities with the basic function of enclosing usable space), structures (facilities with the basic function of a research or operational tool or activity), and other real property improvements (NHB 7330.1, 27).

Field Installation. A NASA organizational element located geographically apart from NASA Headquarters and headed by a Director. The following are NASA field installations:

- Ames Research Center
- Electronics Research Center, disestablished June 30, 1970
- Flight Research Center/Hugh L. Dryden Flight Research Center, as of January 8, 1976
- Goddard Space Flight Center
- John F. Kennedy Space Center
- Langley Research Center
- Lewis Research Center
- Manned Spacecraft Center/Lyndon B. Johnson Space Center, as of February 17, 1973
- George C. Marshall Space Flight Center
- National Space Technology Laboratories, established June 14, 1974
- Wallops Station/Wallops Flight Center, as of April 14, 1974

The Jet Propulsion Laboratory is not a NASA field installation but is operated by the California Institute of Technology under contract to NASA.

The Space Nuclear Propulsion Office/Space Nuclear Systems Office was not a NASA field installation but reported to the NASA Headquarters Office of Advanced Research and Technology.

Industrial Facility. NASA property that is contractor held. Figures for industrial property are included with NASA's in-house property in all tables, unless otherwise noted.

Installation. A NASA organizational element, including both Headquarters and field installations (NMI 1132.2A).

Installed Property. Items of fixtures and equipment normally required

²NASA, Office of Administration, Financial Management Division, *Financial Management Manual*, paragraph 9250-32a, 32b.

for the functional use of a building or structure, the removal of which would impair the usefulness, comfort, and safety of the building or structure. Installed property is included as part of the building or structure and is accounted for accordingly. Examples of installed property items included as real property are plumbing fixtures and equipment, electrical and fixed fire protection systems, overhead crane runways, components that become part of a system, and other similar built-in or permanently affixed items (NMI 8800.1A). See Integral Equipment.

Investment Value, Total. A figure representing the total of (a) real property value, including land, buildings, and other structures and facilities; (b) leasehold improvements value; (c) capitalized equipment value; and (d) assets-in-progress value. Value is based on cost plus improvements.

Note: As used in Chapter Two, total investment value includes both in-house and contractor-held facilities.

Land. A category of real property that includes all acquired interests in land (for example, owned, leased, or acquired by permit) but excludes NASA-controlled easements and rights-of-way that are under leasehold improvements (NMI 8800.1A).

Note: As used in the tables of Chapters Two and Six, land includes only NASA-owned land unless otherwise noted. Figures presented for this variable do not include leased land or land held under use permit or agreement. NASA-owned land means Government-owned land for which NASA has custody and accountability.

Lease. An instrument conveying land, buildings, or other structures or facilities or portions thereof for a specified term of time, in consideration of payment of a rental fee (NHB 7330.1, 28).

Leasehold Improvements. Improvements made by or on behalf of NASA to leased land, buildings, or other structures and facilities; easements and rights-of-way (NMI 8800.1A).

Note: Although NASA Management Instruction 8800.1A deems leasehold improvements a category of real property, they are considered as a separate component of total investment value in Chapter Two.

Other Structures and Facilities. Category of real property that includes facilities having the basic function of research or operational tools or activities as distinct from buildings, which have the primary function of enclosing usable space. Includes all structures and facilities and installed property owned or leased by or on behalf of NASA, for example, storage tanks, gantry cranes, launch pads, blockhouses, airfield pavements, roads, monuments, sidewalks, parking areas, and fences. Excludes leasehold improvements (NMI 8800.1A).

Personal Property. Items of equipment that are installed in a building or structure to perform or assist in performing the operation housed within the buildings or structures and that, if removed, would retain their identity and usefulness as individual items of equipment, for example, a machine tool installed in a building (NMI 8800.1A). See Collateral Equipment.

Real Property. Land, buildings, structures, and utilities systems and their improvements and appurtenances, permanently annexed to land. Real

property includes equipment attached to and made a part of buildings, structures, and other facilities (such as heating systems) but excludes collateral equipment (such as machine tools) that is removable without significant damage to the real property (NHB 7330.1, 29).

Real property—when under the control of the United States or of any instrumentality, entity, or wholly owned corporation of the United States—means any interest in land, excluding lands in the Public Domain or reserved or dedicated for National Forest or National Park purposes, and any fixture, structure, appurtenance, or other improvement permanently annexed to land, including lands to which the United States has no title or interest and lands in the Public Domain or dedicated or devoted to National Forest or National Park purposes (NMI 8800.1A).

Note: In the tables of Chapters Two and Six, total real property value is the sum of land value, buildings value, and other structures and facilities value. Leasehold improvements are not included in total real property value but are considered as a separate component of total investment value.

Use Permit. A document conferring temporary permission to NASA to use land, buildings, structures, or other facilities for which another Government agency has custody and accountability.

NASA Installations and Abbreviations

For installation summaries, see Chapter Six.

CHAPTER THREE

NASA PERSONNEL

When NASA was created on October 1, 1958, its work force consisted of 8,000 in-house employees. In the ensuing years, NASA experienced a period of rapid growth in its in-house employees, reaching a peak of over 36,000 persons in 1967. The trend was reversed during the second decade of NASA's existence, when the number of NASA in-house employees steadily declined from 33,929 in 1969 to 23,779 in 1978, a decrease of almost 30 percent. At the same time, there was a significant change in the composition of NASA employees. In 1969 scientists and engineers made up slightly less than 42 percent of NASA's in-house work force, but by 1978 they constituted almost 50 percent of NASA's in-house employees. During the same period, there was also a slow but steady increase in the percentage of professional administrative employees at NASA. The percentage of NASA employees engaged in trades and labor, however, declined from 13 percent in 1969 to just over 6 percent in 1978, and there was a slight decline in the percentage of clerical and technical support employees. The changing character of NASA's work force during the second decade of its existence can be further demonstrated by the fact that an increasingly large share of its employees possessed professional degrees. Whereas only slightly less than half of NASA's permanent employees had professional degrees in 1969, almost 59 percent of NASA's permanent employees possessed them in 1978.

Because of an improved reporting system in the 1970s (particularly since 1972), this volume takes a closer look than the previous volume at the position of minorities and women within NASA's in-house work force. Between 1972 and 1978, the total number of minority employees increased from 1,290 (4.7 percent of NASA's total permanent in-house work force) to 2,061 (8.9 percent of the total). This growth in minority employment at NASA was spread uniformly over every minority category—Black, Hispanic, Asian, and American Indian. The most significant growth occurred among employees in the professional administrative branch of NASA, where the minority share rose from 3.0 percent in 1972 to 9.8 percent in 1978. Also, the percentage of minorities among technical support personnel and clerical personnel doubled, and it increased from 3.4 percent to 5.7 percent among scientists and engineers. In each of these categories, there

PRECEDING PAGE BLANK NOT FILMED

65

PAGE 64 INTENTIONALLY BLANK

was also a marked numerical increase in minority employees, although the overall permanent NASA work force shrank considerably between 1972 and 1978. Between 1972 and 1978, however, there was a slight decline in the average GS grade level of minority employees in each of the employment categories.

During the same period, the number of women in NASA's permanent in-house work force remained nearly constant, declining slightly from 4,449 in 1972 to 4,400 in 1978. Overall, women made up 16.2 percent of NASA's total permanent work force in 1972 and 19.0 percent in 1978. Only in the professional administrative positions did women make significant progress; the number of women in these positions rose from 535 (14.1 percent of the NASA total) in 1972 to 809 (23.3 percent of the NASA total) in 1978. The overwhelming majority of women, however, were employed as clerical personnel, constituting 88.3 percent of all NASA clerical employees in 1972 and 92.1 percent in 1978.

A more detailed analysis of NASA's work force can be made from the tables that follow. Tables 3-1 through 3-5, as well as Figure 3-1, give an overall view of the agency's in-house personnel. Tables 3-6 through 3-27 present an analysis of personnel data by installation. Tables 3-28 through 3-33 deal with minority employees, and Tables 3-34 through 3-38 provide a similar analysis of the agency's female employees. The last table, Table 3-39, gives the age profile of NASA's permanent in-house employees. (Jet Propulsion Laboratory employees are not listed because they are employed by the California Institute of Technology, under contract to NASA.)

Definition of Terms

Many of the terms used in the tables of this chapter are defined in NASA Management Instruction 3291, Subject: Personnel Definitions and Reporting Requirements. All of the quotations that follow are from this NASA Management Instruction.

Excepted Employees. Civil servants who fill high-level permanent positions created under the provisions of Section 203(b) of the Space Act of 1958. (P.L. 313 and Executive Pay Act employees are included under this heading for the purposes of this chapter.)

Grade. A civil service categorization scheme to differentiate levels of pay, duties, responsibilities, and so forth. Excepted positions are paid in the range from GS-16 to GS-18 and above. Wage System pay is locally rather than nationally set.

Military Detailees. Military personnel detailed to NASA. See Paid Employees.

Occupational Code Groups. The definitions that follow are taken from NASA Management Instruction 3291.

100—Trades and Labor Positions: "Includes trade, craft and general laboring positions (non-supervisory, leader and supervisory), compensated on the basis of prevailing locality wage rates."

200—Support Engineering and Related Positions: “Includes professional physical science, engineering, and mathematician positions in work situations not identified with aerospace technology.”

300—Technical Support Positions: “Includes scientific and engineering aid, technician, drafting, photography, illustrating, salaried shop superintendents, quality assurance specialists, production planning and inspecting positions.”

500—Clerical and Non-Professional Administrative Positions: “Includes secretarial, specialized and general clerical, and administrative specialist positions, the qualification requirements for which are clerical training and experience or specialized non-professional experience in supply, fiscal, procurement and similar or related activities.”

600—Professional Administrative Positions: “Includes professional management positions in research and development administration in such activities as financial management, contracting, personnel, security, administration, law, public affairs and the like for which a college degree or the equivalent, and specialized training and experience are required.”

700—Scientific and Engineering Positions: “Includes professional scientific and engineering positions requiring Aero-Space Technology (AST) qualifications. Includes professional positions engaged in aerospace research, development, operations, and related work including the development and operation of specialized facilities and supporting equipment.”

900—Life Science Positions: “Includes life science professional positions not requiring AST qualifications. Includes medical officers and other positions performing professional work in psychology, the biological sciences and professions which support the science of medicine such as nursing and medical technology.”

Paid Employees. Permanent employees and temporary employees combined. Specifically excluded from this category are military personnel detailed to NASA regardless of any reimbursement.

Permanent Employees. Defined as “all employees whose appointments are not time limited or . . . are for a period of more than one year.”

Temporary Employees. These are called “Other Than Permanent” in the currently used Personnel Management Information System (PMIS) and include “employees whose appointments are specifically limited to definite periods of one year or less” and others who are included in this category by definition (such as CO-OP [cooperative; alternating work and study] students and intermittent employees).

CHAPTER FOUR

NASA FINANCES

This chapter presents, in tabular form, a very brief overview of NASA financing from 1969 through 1978. Summary financial data for the decade—budget requests, congressional authorizations, congressional appropriations, obligations, and expenditures—are presented in Tables 4-1 through 4-7. The data are further broken down by dollar amounts allocated annually to administrative operations (renamed research and program management in 1970), research and development, and construction of facilities. The annual budget process, listing the transfer of funds among these three categories, is presented in more detail in Tables 4-8 through 4-17. Tables 4-18 through 4-20 show annual appropriations for administrative operations, research and development, and construction of facilities by installation. Tables 4-21 and 4-22 focus on the appropriation of funds for research and development for NASA's programs. Figure 4-1 shows, in graphic form, the changes in the offices and programs under which NASA's research and development was carried out between 1969 and 1978.

During the first decade of its existence, NASA's appropriations amounted to almost \$32.4 billion. They rose only slightly in the next decade, totaling \$36.4 billion for the 1969–78 period. The funds were appropriated predominantly for research and development: 81.5 percent in the first decade and 76.5 percent in the second decade. Administrative operations commanded an increasingly large slice of the appropriated funds, growing from 10.9 percent of the total in the first decade to 21.2 percent of the total in the second decade. As expected, there was a considerable difference in the allocation of funds for the construction of facilities in the two decades. During the first decade, when most of the construction took place, 7.6 percent of NASA's appropriation was allocated to this category. During the second decade, only 2.3 percent was allocated to this category.

The information presented in this chapter provides only a small portion of the financial data accumulated between 1969 and 1978. An analysis of the entire budgeting and financial management process is beyond the scope of this volume.

Stages in the NASA Financing Process

*Long-Range Financial Planning.*¹ NASA's financial planning function flowed from its project planning efforts. These complex efforts are beyond the scope of this volume and are not summarized here.

Preparing NASA's Annual Budget. This step includes the preparation of spending proposals by NASA's field installations, the aggregation and winnowing of these proposals by NASA Headquarters, the receiving of Presidential guidelines from the Bureau of the Budget, and the subsequent reconciliation of differences between NASA and the Bureau. (Little data are available on what NASA stood ready to spend if resources had been made available. The general assumption is that agencies always want more and ask for more than they eventually get.)

President's Budget Submitted to Congress. The President's January budget submission to Congress publicly reveals NASA's portion of the overall national budget and constitutes the basis for subsequent congressional action. (The President's requests for NASA, hereafter referred to as NASA's budget requests, have been summarized in this chapter. The total for the agency is comparable over time, but any breakdowns of the total are subject to changing definitions, as indicated in the footnotes.)

Congressional Authorization. The President's budget is primarily a request for congressional appropriations. In addition, for certain agencies and programs, it is necessary for Congress to enact a law authorizing the appropriation. This two-step process applies to NASA.² The authorization law is largely the product of the House Committee on Science, Space, and Technology and the Senate Committee on Commerce, Science, and Transportation, although it may be altered on the House and Senate floors and in the House-Senate Conference Committee.

Congressional Appropriation. It is at this point that Congress makes its chief input as to the amount of national resources allocated to NASA. The President's request may be modified at five principal points—the House Committee on Appropriations subcommittee, the House floor, the Senate Committee on Appropriations subcommittee, the Senate floor, and the compromising conference committees. It is possible that the full appropriations committees of the House and Senate may become involved as well.

Bureau of the Budget Apportionment. The Bureau of the Budget establishes certain controls on the release of appropriated funds to the various agencies.

NASA Programming. Once NASA has obtained primary jurisdiction over the funds appropriated to it by Congress, a detailed pie-cutting operation takes place. Funds are earmarked for various programs, projects, and places, setting the stage for the ongoing spending.

¹See Rosholt, *Administrative History of NASA*, pp. 211–17, and Levine, *Managing NASA in the Apollo Era*, pp. 182–202.

²*Ibid.*, p. 60, gives the origin of this requirement.

Committing, Obligating, Costing, and Disbursing. The flow of financial activity is complex and is beyond the scope of this volume. Only summaries can be shown in the tables. NASA carries out most of its program by contract. Whenever a contract is entered into, an appropriate amount of money is obligated to fulfill the terms of the contract. At some later point, the money actually changes hands and thus is disbursed or expended.

Auditing. The financial activities described above are eventually reviewed or audited both by NASA and by the congressional General Accounting Office to determine the legality of all actions and in some cases the quality of agency procedures and performance.

CHAPTER FIVE

NASA PROCUREMENT

NASA's policy of contracting for most of its goods and services was established by the Space Act of 1958. Large-scale procurement expanded rapidly, and between 1962 and 1968 more than 90 percent of NASA's annual expenditures were for payments to outside contractors for a wide range of products and services. Total payments to outside contractors for goods and services during the decade 1969-78 amounted to \$32,133.3 million, or 86.4 percent of NASA's total expenditures in that decade. The slight overall decline in the percentage of NASA's expenditures allocated to procurement during 1969-78 may be partially explained by the fact that construction of research facilities and installations had been almost completed in the previous decade and goods and services from outside contractors for this purpose were no longer needed. The annual net value of NASA procurement during this period ranged from a low of \$2,673.4 million in 1973 to a high of \$3,659.6 million in 1978. Because the number of procurement actions declined steadily from a high of 307,700 in 1969 to a low of 153,700 in 1978, the average value of a procurement action increased considerably during this decade.

Participants in the NASA procurement program consisted of business firms, educational institutions, private research organizations, and government agencies. Between 1969 and 1978, business firms received almost 80 percent of NASA's total procurement value, with large business firms receiving 92 percent of the total amount allotted to business firms. Of the total value of NASA procurement to business contractors, 65 percent represented competitive awards and 35 percent noncompetitive awards. Government agencies and the Jet Propulsion Laboratory, operated by the California Institute of Technology, were next with about 7 percent of the total value of NASA procurement each, followed by educational institutions with 3.9 percent, and nonprofit institutions and contractors from outside the United States with 1 percent each.

The Far West region of the United States consistently led in the total value of awards granted by NASA, ranging from a low of 23 percent in 1971 to a high of 53 percent in 1976. The Southeast region followed with a 20 percent average annual share of contracts awarded, the Mideast region came next with about 17 percent, and the Southwest region had about 10

percent. During the ten-year period, every state and the District of Columbia participated at one time or another in NASA's procurement program. California ranked first as the state consistently receiving the largest share of the total value of contracts awarded, its share being almost 52 percent of the total in 1976. Of the educational institutions participating in NASA's procurement program, the Massachusetts Institute of Technology ranked first nine times out of ten in the net value of awards granted annually by NASA to educational and nonprofit institutions.

From the very inception of the procurement program, NASA's policy has been to decentralize responsibility for the administration of the program. Field installations were given the right to oversee procurement that directly affected their own research and development work and that fell within certain dollar limits. Although the Administrator, the Deputy Administrator, and the Associate Deputy Administrator had final authority over the procurement process, day-to-day oversight of the procurement process rested in the early 1970s with the Associate Administrator for Organization and Management. In 1974 the Office of Procurement was established (headed by an Assistant Administrator), and in 1978 the position of Director of Procurement was created.

Stages in the NASA Procurement Process¹

Procurement Request. Once a project has been approved and a decision made as to the degree of external participation, the responsible organizational unit prepares a procurement request (PR). The PR, after approval by the proper operating officials, becomes the basic working document for the procurement specialist. The PR includes a description of what is wanted and what additional information is needed (suggested suppliers, security classification, etc.).

Procurement Plan. On the basis of the PR and other available information, the procurement specialist draws up a procurement plan. This plan outlines in detail each subsequent step to be taken to carry out the procurement action. It includes a description of the items to be procured, a list of all known sources, a schedule for completing each major phase of the action, the recommended kind of contract to be used, and special provisions to be included in the contract. If the items to be procured can be clearly and completely defined in specifications and drawings, formal advertising for competitive bids is possible. If the items cannot be well defined (and most work in research and development cannot), the negotiation route must be taken, whereby negotiations with potential suppliers (called "sources") are conducted on the basis of competitive technical and business proposals submitted to NASA. The "formal advertising" route usually results in a fixed-price contract, whereas the "negotiation route" usually involves a cost reimbursement contract—normally the cost-plus-a-fixed-

¹Rosholt, *Administrative History of NASA*, pp. 63–65.

fee (CPFF) variety. In NASA, 90 percent of the procurement dollar is spent via the negotiation route.

When the procurement plan has been approved by the proper authorities, the stage is set for solicitation.

Soliciting Proposals. At this stage an attempt is made to keep things as competitive as possible. When formal advertising is used, the procurement action is publicized as widely as possible, and an "Invitation for Bid" (IFB) is sent to each interested supplier. The IFB contains all the information needed to prepare a bid. It is the crucial instrument in bringing user and supplier together.

Negotiation is more complicated. An instrument called a "Request for Proposal" (RFP) is used instead of an IFB. Because a proposal is infinitely more complicated and expensive to prepare than a bid, NASA attempts to limit the sending of RFPs to parties known to be qualified. This necessitates a screening process, which may be done informally through letters and telephone calls or formally through a "pre-proposal conference" held with interested parties. After the screening, RFPs are sent to firms considered to have the required experience, facilities, and capabilities. A firm may submit a proposal even if it does not initially receive an RFP. All larger RFPs are announced in the Department of Commerce's *Business Daily*, and thus any firm may request them.

Bid and Proposal Evaluation. When formal advertising is used, it is necessary to make sure that the low bidder is qualified and that his bid meets all requirements. When negotiation is used, a much more elaborate evaluation process is necessary because cost figures are only one factor to be considered. Proposals are usually evaluated from three angles—the quality of the proposal (design, cost, schedules, etc.), the technical competence of the proposer (personnel, facilities, experience), and the managerial competence of the proposer (reporting system, accounting system, etc.). The RFP includes the criteria on which the evaluation is made. Administrative and legal personnel, as well as technical personnel, participate in proposal evaluation.

Source Selection, Contract Negotiation, and Contract Award. In formal advertising, a standard contract is awarded to the lowest qualified bidder. When negotiation is used, a decision is made, based on the evaluation described above, on the selection of the supplier to do the work. After selection, negotiations are begun to iron out the details of the contract. Because a CPFF contract is used in most cases, thorny problems of clarifying costs and determining the fee must be solved. When both sides agree, the actual contract award is made.

Contract Administration. The award of a contract is only part of the overall procurement process. What follows afterward may be even more significant. It is true that the contractor has primary responsibility for performance and that, for routine procurements, contract administration may consist of only taking delivery of the goods or services. In contracting for research and development, however, numerous interim problems arise in which NASA has a vital interest. In such cases, reviewing and evaluating

the contractor's progress is very important and may become a specialty in itself. Elaborate reporting techniques have been developed, which sometimes reveal the need for NASA to provide technical or administrative assistance to the contractor. NASA may approve certain contractor actions that require changes in costs. In certain cases, the contract may need to be modified or terminated.

Contract administration involves NASA operating technicians, procurement specialists, and people from such activities as safety, reporting, and security.

Definition of Terms

Advertised Award. Procurement action resulting from acceptance of bids made by contractors in response to formal advertising.

Award. See Procurement Action.

Competitive Negotiation. Procurement action resulting from soliciting proposals or obtaining bids from two or more sources.

Direct Action (Direct Award). Procurement action placed directly with business firms or nonprofit institutions or organizations. The term excludes procurement actions placed with or through other Federal agencies.

Intergovernmental Award. Procurement action placed with or through other Federal agencies.

Modification. Any written alteration in the specifications, delivery point, rate of delivery, contract period, price, quantity, or other contract provision of an existing contract, whether accomplished by unilateral action in accordance with a contract provision or by mutual action of the parties to the contract. It includes (a) bilateral actions, such as supplemental agreements, and (b) unilateral actions, such as change orders, notices of termination, and notices of the exercise of an option.

Negotiated Award. Procurement action resulting from negotiation procedures authorized under Title 10 U.S.C.2304(a).

Net Value. Net amount of obligations resulting from debit and credit procurement actions.

Noncompetitive Negotiation. Procurement action resulting from the solicitation of proposals from only one source.

Procurement Action (Award). Any of the following transactions that obligate or deobligate funds:

- a. Letter contracts or other preliminary notices of negotiated awards.
- b. Definitive contracts, including purchase orders.
- c. Orders against indefinite delivery contracts.
- d. Modifications.

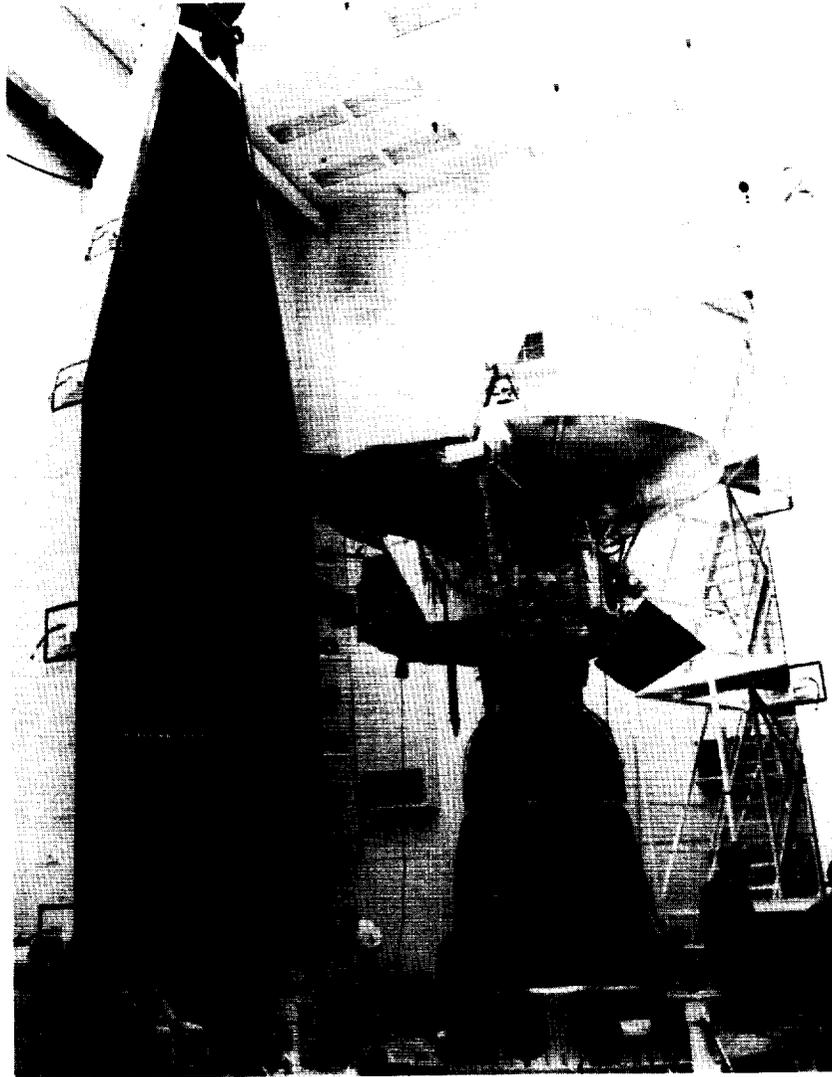

Small Business. A concern that meets the pertinent criteria established by the Small Business Administration and set forth in Paragraph 1.701 of the NASA Procurement Regulation. Generally, a small business concern

is one that is independently owned and operated, is not dominant in its field of operations, and with its affiliates does not employ more than a specified number of persons (usually not more than 500, 750, or 1,000), depending on the product called for by the contract. For construction and some service industries, the criterion is a specified annual dollar volume of sales or receipts instead of the number of employees.

Table 5-13. Twenty Largest Contracts During FY 1978
(in millions of dollars)

Contractor	Contract Description	Contract Number	FY 1978 Amount	Cumulative Amount to 1978
Rockwell International Corp.	Design, development, testing, and evaluation of the Space Shuttle Orbiter Vehicle, integration of all elements of the Space Shuttle System, and operational planning.	NAS9-14000	666	3,439
Rockwell International Corp. Martin Marietta Corp.	Design of main engine for the Space Shuttle.	NAS8-27980	188	728
	Design, development, testing, and evaluation of the Space Shuttle external tank.	NAS8-30300	78	273
Bendix Corp.	Maintenance and operation of the Space Flight Tracking and Data Network.	NAS5-22880	70	151
Thiokol Corp.	Design, development, testing, and evaluation of the Space Shuttle solid rocket motors.	NAS8-30490	56	168
Lockheed Electronics Co., Inc.	Engineering, scientific, and computing center support services at the Johnson Space Center.	NAS9-15200	55	103
McDonnell Douglas Corp.	Two-year launch capability for Delta Space Vehicles.	NAS5-24317	51	(new contract)
Boeing Services International, Inc.	Ground systems operations in support of launch operations at the Kennedy Space Center.	NAS10-9200	34	44
Hughes Aircraft Co.	Design, development, and testing of a thematic mapper instrument for Landsat-D.	NAS5-24200	27	32

Table 5-13. Twenty Largest Contracts During FY 1978 (Continued)
(in millions of dollars)

Contractor	Contract Description	Contract Number	FY 1978 Amount	Cumulative Amount to 1978
Ford Aerospace and Communications Corp.	Ground data hardware and software systems, engineering, implementation, maintenance, and operations for mission control center.	NAS9-15014	26	55
Planning Research Corp.	Systems engineering design and engineering support services for Space Shuttle program.	NAS10-8525	25	82
General Dynamics Corp.	Material and components for assembly of Atlas and Centaur vehicles.	NAS3-19150	24	43
Rockwell International Corp.	Shuttle orbiter site activation and orbiter/main engine (SSME) flight test operations at the Kennedy Space Center.	NAS10-9100	24	33
McDonnell Douglas Corp.	Procurement of Delta space vehicles and related equipment.	NAS5-24084	24	44
Int'l Business Machines Corp.	Space Shuttle Orbiter Vehicle avionics software development.	NAS9-14444	24	74
Air Products and Chemicals, Inc.	Liquid hydrogen.	NAS8-31034	23	36
Martin Marietta Corp.	Consolidated facilities contract in support of Space Shuttle external tank.	NAS8-30382	21	51
Computer Sciences Corp.	Communications and instrumentation support services at the Kennedy Space Center.	NAS10-9130	19	20
Int'l Business Machines Corp.	Software for the ground-based computing and data processing system.	NAS9-14350	19	49
RCA Corp.	Long lead items for TIROS-N/NOAA A-G follow-on spacecraft.	NAS5-22330	19	62

				TOTAL AWARDS TO BUSINESS FIRMS		3,022,333	100.00

Awards during year represent awards on several contracts which have different principal places of performance. The place shown is that which has the largest amount of the awards.

(S) = Indicates small business concerns.

(JV) = Joint venture.

*Data for individual companies include awards on research and development contracts of \$10,000 and over and on all other contracts of \$25,000 and over.

NASA INSTALLATIONS

Introduction

This chapter reviews the history and the mission of NASA Headquarters and the thirteen NASA installations that were in existence during the 1969-78 decade. It also provides, in tabular form, detailed information regarding the property, personnel, funding, and procurement activity of each installation during this period.

In addition to NASA Headquarters, in 1969 there were twelve NASA field installations and the contractor-operated Jet Propulsion Laboratory. Five of the installations—the Ames Research Center, the Flight Research Center, the Langley Research Center, the Lewis Research Center, and Wallops Station—had been facilities of the National Advisory Committee for Aeronautics. With the establishment of NASA in 1958, these facilities were transferred to NASA. The Goddard Space Flight Center, the Kennedy Space Center, the Marshall Space Flight Center, and the Jet Propulsion Laboratory were transferred to NASA from the United States military space program in the next few years. The Space Nuclear Propulsion Office was established in 1961 jointly with the Atomic Energy Commission. The Electronics Research Center was established as a NASA installation in 1964. During the next decade, two installations were disestablished as NASA installations—the Electronics Research Center in 1970 and the Space Nuclear Propulsion Office (renamed the Space Nuclear Systems Office in 1970) in 1973. A new NASA installation—the National Space Technology Laboratories—was established in 1974. (For a more comprehensive history of NASA installations during the 1958-68 period, see Chapter VI of *NASA Historical Data Book*, Vol. I.)

In general, NASA's aim has been to create a relationship between NASA Headquarters and the installations that would allow the installations to have "the institutional management, resources, and freedom to perform the Agency's programs without their becoming too independent and separated from the Agency's priorities and goals." Administrative control of NASA installations has undergone several changes, reflecting the overall changes in NASA organization. In 1968 NASA installations were under the control

of three separate offices, each headed by a NASA Associate Administrator who reported to the Associate Deputy Administrator. The Ames Research Center, the Electronics Research Center, the Flight Research Center, the Langley Research Center, and the Lewis Research Center were administered by the Office of Advanced Research and Technology. The Marshall Space Flight Center, the Manned Spacecraft Center, and the Kennedy Space Center were administered by the Office of Manned Space Flight. The Goddard Space Flight Center, the Jet Propulsion Laboratory, and Wallops Station were administered by the Office of Space Science and Applications. In 1972 the Office of Space Science and Applications was split into the Office of Space Science and the Office of Applications, and the three installations formerly under the combined office were now administered by the Office of Space Science. In 1974 NASA installations were removed from under the control of the three offices that had administered them in the past and were placed under the control of the newly created Office of Associate Administrator for Center Operations. The NASA reorganization of 1978 did away with the Associate Administrator for Center Operations, and NASA installations were placed under the direct control of the Administrator himself. (For a detailed view of the changes in the NASA organizational structure, see Appendix B.)

Note: Sources for the discussion of individual installations are *NASA Historical Data Book*, 1, 1988; NASA, *The Evolution of the NASA Organization*, 1985; and NASA, *Facilities Data*, 1974.

Table 6-1. Distribution of Research and Development Budget Plan by Installation and Program Office: FY 1978
(in thousands of dollars)

Installation	Space Transportation Systems		Space Science	Space and Terrestrial Applications		Aeronautics and Space Technology		Tracking and Data Acquisition		Total Budget Plan
Ames Research Center (Percentage of total budget plan)	470 (0.4)		55,317 (49.1)	7,048 (6.3)	49,803 (44.2)	—				112,638 (3.7)

Aerial view of the NASA Headquarters buildings in Washington, D.C. taken in March 1974. NASA Administrative Offices were located in Federal Office Building 6 on Maryland Avenue. NASA Offices for Manned Space Flight, Aeronautics and Space Technology, and Applications were located in Federal Office Building 10-B on Independence Avenue. The National Art Museum and the Capitol Mall are in the background.

A close-up of Federal Office Building 10-B.

NASA HEADQUARTERS

Location

In 1978 the main offices of NASA Headquarters were located at 400 Maryland Avenue, S.W., Washington, D.C. In addition, NASA occupied other buildings, either owned or leased by the Government, in the District of Columbia and in northern Virginia.

Administrator:

Robert A. Frosch (June 1977-)
James C. Fletcher (April 1971-May 1977)
George M. Low, Acting (September 1970-April 1971)
Thomas O. Paine (March 1969-September 1970)
Thomas O. Paine, Acting (October 1968-March 1969)
James E. Webb (February 1961-October 1968)
T. Keith Glennan (August 1958-January 1961)

Deputy Administrator:

Alan M. Lovelace (July 1976-)
George M. Low (December 1969-June 1976)
Thomas O. Paine (March 1968-March 1969)
Robert C. Seamans, Jr. (December 1965-January 1968)
Hugh L. Dryden (September 1958-December 1965)

Associate Administrator:

John E. Naugle (November 1975-November 1977)
John E. Naugle, Acting (April 1975-November 1975)
Rocco A. Petrone (March 1974-April 1975)
Homer E. Newell (October 1967-December 1973)
Robert C. Seamans, Jr. (September 1960-October 1967)
Richard E. Horner (June 1959-July 1960)

History

The development of NASA Headquarters and its early history are described in *NASA Historical Data Book*, I. During the decade 1969-78, the agency underwent several reorganizations affecting both management control over program offices and field installations as well as the staff

structure of the Administrator's office. The changes in NASA administration wrought by the 1978 reorganization included placing both program offices and field installations directly under the Administrator and creating, among others, the positions of Assistant for Special Projects within the Administrator's office, Chief Scientist, General Counsel, and Inspector General. In addition, the role of the Office of Public Affairs and that of the Office of International Affairs was downgraded to an advisory function. The Office of Applications became the Office for Space and Terrestrial Applications, and the Office of Space Flight became the Office for Space Transportation Systems. The Office of University Affairs, the Office of Industry Affairs and Technology Utilization, and the Office of DOD and Interagency Affairs were among the offices that were disbanded.

Mission

The mission of NASA Headquarters was to maintain the overall management of all NASA installations. Headquarters set policies and determined programs and projects; it drew up procedures and performance criteria; and it evaluated and reviewed all aspects of the aerospace programs. Headquarters was responsible for the financing of NASA programs, for contracting, and for establishing security procedures. The NASA Pasadena Office, a component installation of Headquarters, was responsible for administering the contract with the California Institute of Technology for the operation of the Jet Propulsion Laboratory.

AMES RESEARCH CENTER

PREVIOUS PAGE BLANK NOT FILMED

288

An aerial view of Ames Research Center at Mountain View, California, adjacent to the United States Naval Air Station at Moffett Field, California taken on February 11, 1976.

A C-141A carrier aircraft based at Ames Research Center served as NASA's Airborne Infrared Observatory.

AMES RESEARCH CENTER

Location

The Ames Research Center was located at the south end of San Francisco Bay, thirty-five miles southeast of San Francisco, California. It was adjacent to the United States Naval Air Station at Moffett Field, California.

Director:

Clarence A. Syverston (April 1978-)
Clarence A. Syverston, Acting (August 1977-April 1978)
Hans Mark (February 1969-August 1977)
H. Julian Allen (October 1965-February 1969)
Smith J. DeFrance (October 1958-October 1965)

Deputy Director:

A. Thomas Young (February 1979-)
Clarence A. Syverston (February 1969-April 1978)

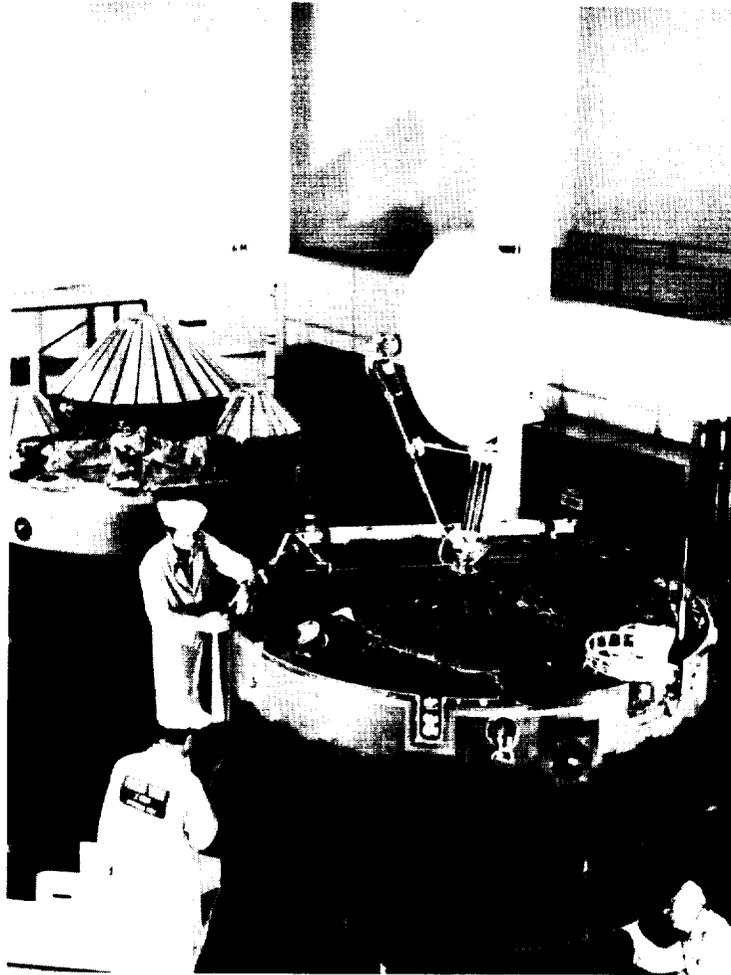

History

The Moffett Field Laboratory began operations as a facility of the National Advisory Committee for Aeronautics (NACA) in early 1941. In 1944 it was renamed the Ames Aeronautical Laboratory in honor of Dr. Joseph S. Ames, chairman of NACA from 1927 to 1939, former president of Johns Hopkins University, and a leading authority on aerodynamics. With the establishment of NASA in 1958, the facility became one of the original NASA installations and was renamed the Ames Research Center. (For a more detailed history of the Ames Research Center, see Chapter VI of *NASA Historical Data Book*, Vol. I.)

Mission

Equipped with some of the most advanced, specialized facilities—such as wind tunnels with speed ranges from subsonic to hypersonic, motion-based flight simulators, and experimental aircraft—the Ames Research Center's mission has been to conduct basic and applied research and to

develop technology in the fields of aeronautics, space science, life science, and spacecraft technology. The Ames Research Center was responsible for the Pioneer and Biosatellite space projects. It contributed to the development of short take-off and landing (STOL) and vertical take-off and landing (VTOL) technology and supported the development of NASA's Space Shuttle program.

Technicians at Ames Research Center work on an orbiter to be launched into orbit around the planet Venus in 1978. Next to it is a Pioneer spacecraft to be used to probe the planet's atmosphere and weather.

**ELECTRONICS RESEARCH
CENTER**

ELECTRONICS RESEARCH CENTER

Location

The Electronics Research Center was located in Cambridge, Massachusetts.

Director:

James C. Elms (October 1966-June 1970)
Winston E. Kock (September 1964-October 1966)

Deputy Director:

Albert J. Kelly (September 1964-June 1967)

History

An electronics research facility for NASA was first considered in 1961. In 1962 NASA proposed in its FY 1964 budget request that such a facility be established in the Greater Boston area. After considerable delays and extensive hearings in Congress, construction funds for the proposed facility were appropriated in the 1965 NASA Authorization Act, signed by President Lyndon B. Johnson on July 11, 1964. The Electronics Research Center formally opened as a NASA installation on September 1, 1964. It was in operation, however, for only about five and one-half years. On December 29, 1969, NASA announced its decision to close the center because of budgetary reductions. The Electronics Research Center ceased operations on June 30, 1970, when it was transferred to the Department of Transportation. (For a more detailed history of the Electronics Research Center, see Chapter VI of *NASA Historical Data Book*, Vol. I.)

Mission

Despite its short-lived existence, the Electronics Research Center carried out its mission to organize, sponsor, and conduct programs to improve the performance and reliability of space and aeronautical electronics systems. The center became the focal point for national aerospace electronics research and was the coordinating institution for nationwide research efforts in this field.

Paul F. Bikle (September 1959-May 1971)

Deputy Director:

Isaac T. Gilliam (August 1977-June 1978)
David R. Scott (August 1973-August 1977)
D. E. Beeler (April 1961-August 1973)

History

Originally a facility of the National Advisory Committee for Aeronautics, the High Speed Flight Station became part of NASA upon NASA's formation in 1958 and was renamed the Flight Research Center in September 1959. In January 1976, NASA again renamed the installation, calling it the Hugh L. Dryden Flight Research Center in honor of Dr. Hugh L. Dryden, an aeronautical research pioneer and the first Deputy Administrator of NASA. (For a more detailed history of the Flight Research Center, see Chapter VI of *NASA Historical Data Book*, Vol. I.)

Mission

The Flight Research Center's mission under NASA was to perform research and evaluation of aeronautical flight. It included tests on problems

of takeoff, reentry, and landing for space flight; low speed, supersonic, and hypersonic flight; and other problems associated with both unmanned and manned flight within and beyond the atmosphere. Among its most important research programs were tests of the X-15 rocket aircraft flight, research on the X-24 heavyweight lifting body, and flight investigations of the Space Shuttle vehicle. The center also carried out a research program involving remotely piloted research vehicles, life sciences studies into aircraft ride qualities, wing-wake-vortex operating studies, and aerodynamic and propulsion system noise studies.

GODDARD SPACE FLIGHT CENTER

Location

The Goddard Space Flight Center was located in Greenbelt, Maryland, fifteen miles northeast of Washington, D.C. In addition to its main site, Goddard leased 620 acres of land, located nearby, from the Department of Agriculture where the Goddard Antenna Test Range, the Magnetic Test Facility, the Optical Tracking and Ground Plane Test Facility, the Bi-Propellant Test Facility, and the Network Test and Training Facility were located.

Director:

Robert S. Cooper (August 1976-)
John F. Clark (May 1966-August 1976)
Harry J. Goett (September 1959-July 1965)

Deputy Director:

Robert E. Smylie (December 1976-)
Donald P. Hearsh (April 1970-September 1975)
Vacant (July 1968-April 1970)
John W. Townsend (July 1965-July 1968)

Associate Director:

Eugene W. Wasielewski (October 1960-August 1972)

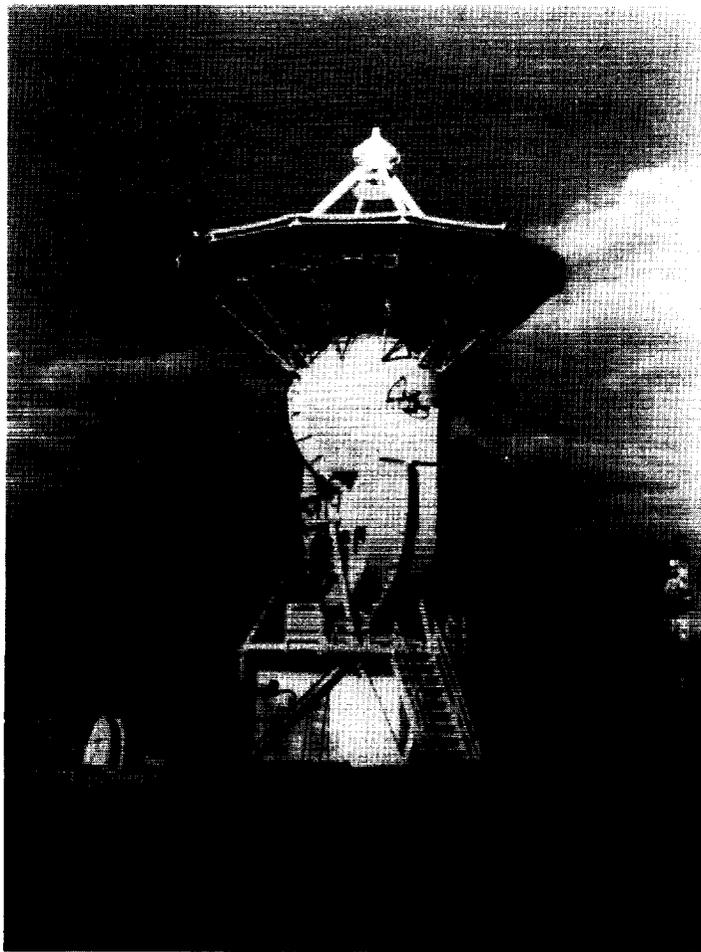

History

In 1958 Congress authorized construction of a NASA "space projects center" in the vicinity of Washington, D.C. Originally named the Beltsville Space Center, the facility officially opened in January 1959. In May 1959, it was renamed the Goddard Space Flight Center in honor of Dr. Robert H. Goddard, the father of American rocketry. Initially, the center was housed at the Naval Research Laboratory until construction of its own facility was complete, on a site that was part of the Department of Agriculture's Beltsville Agricultural Research Center. The Goddard Space Flight

Center was officially dedicated in its new location in March 1961. (For a more detailed history of the Goddard Space Flight Center, see Chapter VI of *NASA Historical Data Book*, Vol. 1.)

Mission

The Goddard Space Flight Center was responsible for automated spacecraft and sounding rocket experiments in support of basic and applied research. Research programs were carried out in such disciplines as aeronomy, energetic particles and fields, ionospheric physics, astronomy, planetary atmospheres, geophysics, and solar physics. The center also managed the development of meteorological and advanced technology satellites, including the Earth Resources Technology Satellite, Nimbus, Applications Technology Satellite F, Atmosphere Explorer, Interplanetary Monitoring Platform, Small Astronomy Satellite, and Synchronous Meteorological Satellite.

BLACK AND WHITE PHOTOGRAPH

KENNEDY SPACE CENTER

Location

The John F. Kennedy Space Center was located on the east coast of Florida, immediately north and west of Cape Canaveral. It lay approximately 150 miles south of Jacksonville and fifty miles east of Orlando.

Director:

Lee R. Scherer (January 1975-)
Kurt H. Debus (March 1962-October 1974)

Deputy Director:

Gerald D. Griffin (July 1977-August 1981)
Miles Ross (June 1970-May 1977)

Deputy Director Center Management:

Albert F. Siepert (February 1963-December 1969)

Deputy Director Center Operations:

Miles Ross (June 1967-December 1969)

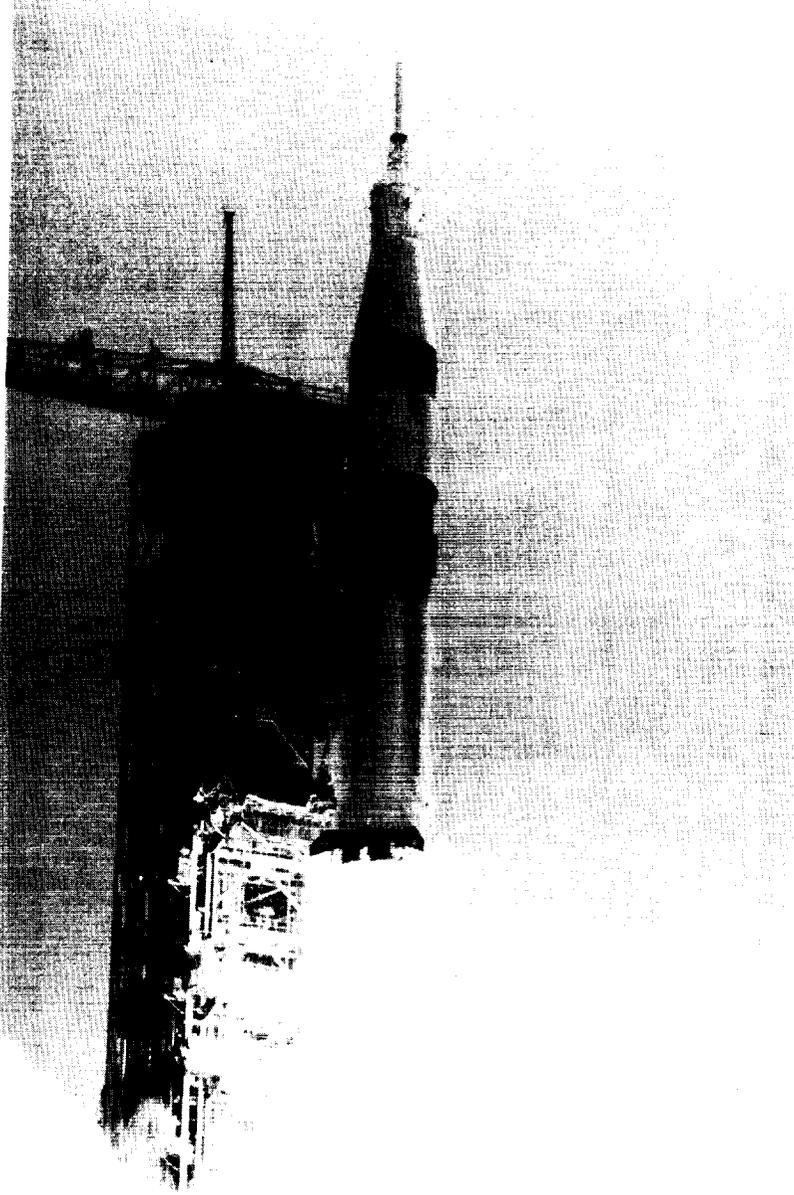

History

The present site of the Kennedy Space Center has been used as a missile launching ground since the late 1940s. Called the Long Range Proving Ground, it became in 1951 the site for test flights of the United States Army's Redstone intermediate-range ballistic missile. In January 1953, the site was renamed the Missile Firing Laboratory, and in July 1960 it became part of NASA's Marshall Space Flight Center's Launch Operations Directorate. The Launch Operations Directorate was disbanded in March 1962. In July 1962, the Cape Canaveral site was established as a separate NASA installation and renamed the Launch Operations Center. In November 1963, less than a week after the death of President John F. Kennedy, President Lyndon B. Johnson renamed it the John F. Kennedy Space Center. In addition to the Cape Canaveral site, since January 1963 the Launch Operations Center also managed and operated the Merritt Island Launch Area adjacent to Cape Canaveral. In July 1965, the headquarters of the Kennedy Space Center moved to new facilities on Merritt Island.

and the whole complex was designated the Kennedy Space Center. (For a more detailed history of the Kennedy Space Center, see Chapter VI of *NASA Historical Data Book*, Vol. I.)

Mission

The Kennedy Space Center has been the primary NASA center charged with the testing and launching of space vehicles. It was responsible for the launching of manned and unmanned vehicles not only at the Kennedy Space Center but also at the Air Force Eastern Test Range and the Air Force Western Test Range. Among its greatest successes in the 1969-78 decade were the Apollo lunar landings, the joint Soviet-American Apollo/Soyuz launches, and participation in the development of the Space Shuttle program. All launching of unmanned space vehicles at the Air Force Western Test Range were under the management and supervision of the Western Test Range Operations Division, a component installation of the Kennedy Space Center located at Vandenberg Air Force Base in California.

Astronauts Charles Conrad, Jr., Dr. Joseph P. Kerwin, and Paul J. Wertz lifting off aboard a Saturn IB rocket from Kennedy Space Center's launch site on May 25, 1973. They will dock their spacecraft with a Skylab space station orbiting the Earth.

LANGLEY RESEARCH CENTER

Flight Control Research Facility at NASA's Langley Research Center in Hampton, Va. was built in 1968 to be used for guidance and control research to support flight missions.

The Langley 14-by-22-Ft Subsonic Tunnel (formerly the 4-by-7-Meter Tunnel) is used for low-speed testing of powered and unpowered models of various fixed- and rotary wing civil and military aircraft. The tunnel is powered by an 8000-hp electrical drive system.

LANGLEY RESEARCH CENTER

Location

The Langley Research Center was located at Langley Field in Hampton, Virginia, approximately 150 miles southeast of Washington, D.C.

Director:

Donald P. Heath (September 1975-)
Edgar M. Cortright (May 1968-September 1975)
Floyd L. Thompson (May 1960-May 1968)
Henry J. E. Reid (October 1958-May 1960)

Deputy Director:

Oran W. Nicks (November 1970-)
Charles J. Donlan (November 1967-May 1968)

Associate Director:

J. E. Duberg (1968-)
Charles J. Donlan (March 1961-November 1967)

History

In 1916 a site near Hampton, Virginia, was selected as the National Advisory Committee for Aeronautics's (NACA) experimental air station. It was called Langley Field in honor of Dr. Samuel P. Langley, the third Secretary of the Smithsonian Institution and a pioneer aviator, scientist, and astronomer. Construction of NACA's first field station at Langley Field began a year later, and in 1920 the new facility was named the Langley Memorial Aeronautical Laboratory. It was the only NACA laboratory until 1940. In October 1958, the laboratory became an installation of NASA and was renamed the Langley Research Center. (For a more detailed history of the Langley Research Center, see Chapter VI of *NASA Historical Data Book*, Vol. I.)

Mission

Throughout its existence, the Langley Research Center has conducted research in the fields of aeronautical and space flight. Much of the research

work has been dedicated toward the development of advanced concepts and technology for future aircraft, both military and civilian. The Langley Research Center had management responsibility for NASA's Lunar Orbiter and Viking Mars Lander programs. It provided support for the unmanned spacecraft programs and many ground-based research programs intended to improve the performance and capability of space vehicles.

LEWIS RESEARCH CENTER

Lewis Research Center in Cleveland, Ohio consists of laboratory buildings, shops, wind tunnels, space environmental tanks, and other facilities built for conducting research on advanced propulsion systems or power-generating systems.

The OV-10B aircraft pictured here is used by scientists at Lewis Research Center to map the distribution and patterns of ice on the Great Lakes. An example of NASA activity, other than space exploration, this effort is part of a federally-funded Winter Navigation Program.

LEWIS RESEARCH CENTER

Location

The Lewis Research Center was located in Cleveland, Ohio, adjacent to the Cleveland Airport.

Director:

John F. McCarthy (October 1978-)
Bernard Lubarsky, Acting (August 1977-October 1978)
Bruce T. Lundin (November 1969-August 1977)
Abe Silverstein (November 1961-October 1969)
Eugene J. Manganiello, Acting (January 1961-October 1961)

Deputy Director:

Bernard Lubarsky (1974-)
Eugene J. Manganiello (December 1961-1972)

Deputy Director Center Management:

Henry C. Barnett (1973-1974)

Deputy Director Center Technology:

Bernard Lubarsky (1973-1974)

History

Authorized by Congress in 1940, the National Advisory Committee for Aeronautics' (NACA's) Aircraft Engine Research Laboratory began operations in 1942. In 1948 this flight propulsion laboratory, adjacent to the Cleveland Airport, was renamed the Lewis Flight Propulsion Laboratory in honor of Dr. George W. Lewis, a leading aeronautical engineer who served as NACA's Director of Aeronautical Research from 1919 to 1947. In 1958 the facility became a NASA installation and was renamed the Lewis Research Center. (For a more detailed history of the Lewis Research Center, see Chapter VI of *NASA Historical Data Book*, Vol. I.)

Mission

The Lewis Research Center has been responsible for research and development on advanced propulsion and space power systems. Its research

programs included work on turbojet engines, supersonic aircraft, high-energy chemicals, electric rocket engines, and experiments on converting chemical and solar energy into electricity. It has used its wind tunnels, space environmental tanks, and other special facilities to simulate flight conditions. Among major programs at the Lewis Flight Center were management responsibilities for the Agena and Centaur launch vehicle stages.

A component installation of the Lewis Research Center, the Plum Brook Station, located on Lake Erie near Sandusky, Ohio, performed large-scale testing of nuclear propulsion components in NASA's nuclear test reactor and conducted full-scale static and dynamic tests of completed space vehicles.

The Plum Brook Reactor within the domed structure and the adjacent facilities are part of the Plum Brook Station in Sandusky, Ohio, a component installation of Lewis Research Center.

JOHNSON SPACE CENTER**

RECORDING PAGE BLANK NOT FILMED

Aerial view of Manned Spacecraft Center near Houston, Texas, a center for human spaceflight.

A close-up of the Project Management Building at Manned Spacecraft Center.

MANNED SPACECRAFT/ JOHNSON SPACE CENTER

Location

The Manned Spacecraft Center was located at Clear Lake, near Houston, Texas. Additional facilities of the center were located at Ellington Air Force Base, approximately seven miles north of the main facility.

Director:

Christopher C. Kraft, Jr. (January 1972-)
Robert R. Gilruth (November 1961-January 1972)

Deputy Director:

Sigurd A. Sjoberg (January 1972-)
Christopher C. Kraft, Jr. (November 1969-January 1972)
George S. Trimble (October 1967-September 1969)
George M. Low (February 1964-April 1967)
James C. Elms (November 1963-February 1964)

History

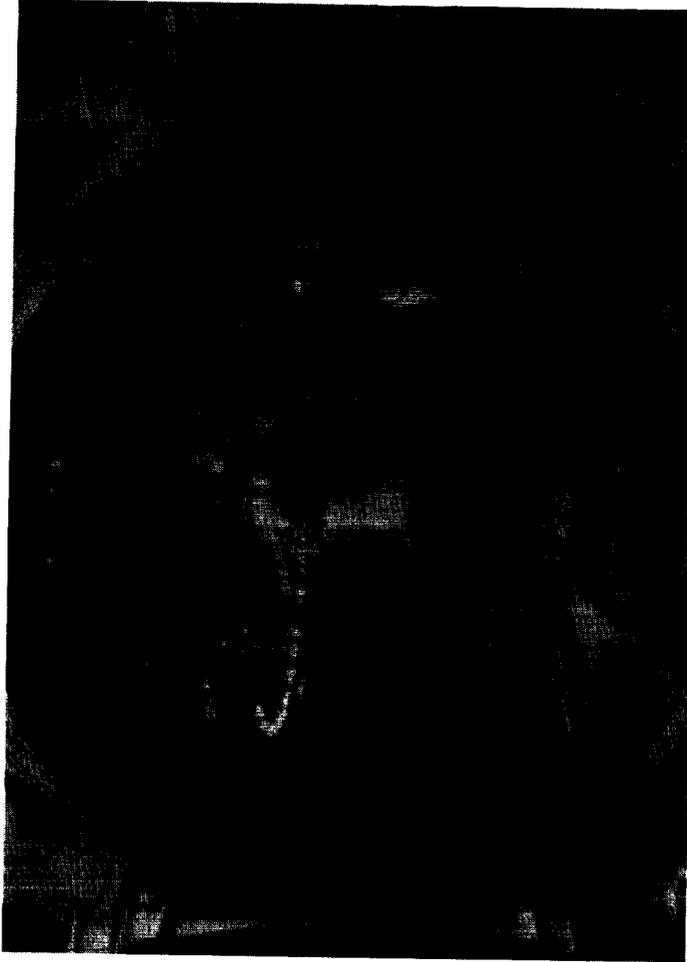

In January 1961, the Space Task Group, an autonomous component of the Goddard Space Flight Center that was located at the Langley Research Center, became an independent NASA installation. Later that year, the installation was renamed the Manned Spacecraft Center, and construction of its new facilities, near Houston, Texas, was begun. In February 1973, the Manned Spacecraft Center was renamed the Lyndon B. Johnson Space Center. (For a more detailed history of the Manned Spacecraft Center, see Chapter VI of *NASA Historical Data Book*, Vol. 1.)

Mission

The Manned Spacecraft Center was NASA's primary center for the design, development, and testing of manned spacecraft, selection and training of astronaut crews, and operation of manned spaceflight missions. The center was responsible for many of NASA's most successful space flight

programs, including the Mercury, Gemini, Apollo, and Skylab missions, as well as the joint Soviet-American Apollo-Soyuz Test Project. It was designated as the lead NASA center for the Space Shuttle and for the Earth Observations Program.

The White Sands Test Facility, a component installation of the Manned Spacecraft Center, was established in 1962 at Las Cruces, New Mexico, for testing Apollo propulsion and power systems.

Thermal-vacuum testing of an Apollo spacecraft inside Chamber A of the Space Environmental Simulation Laboratory at Manned Spacecraft Center.

MARSHALL SPACE FLIGHT CENTER

PRECEDING PAGE BLANK NOT FILMED

The three-building complex of Marshall Space Flight Center in Huntsville, Ala. houses administrative, engineering, and program management offices.

MARSHALL SPACE FLIGHT CENTER

Location

The George C. Marshall Space Flight Center was located at the United States Army's Redstone Arsenal in Huntsville, Alabama.

Director: William R. Lucas (June, 1974-)
Rocco A. Petrone (January, 1973-March, 1974)
Eberhard F. M. Rees (March, 1970-January, 1973)
Wernher von Braun (July, 1960-January, 1970)

Deputy Director:
R. G. Smith (November, 1974-August, 1978)
William R. Lucas (February, 1971-June, 1974)

Deputy Director Technical:
William R. Lucas (1970-February, 1971)
Erich W. Neubert (1970)
Eberhard F. M. Rees (July, 1960-March, 1970)

Deputy Director Management:
R. W. Cook (October, 1969-June, 1970)
Harry H. Gorman (November, 1961-October, 1969)
Delmar M. Morris (July 1, 1960-September, 1961)

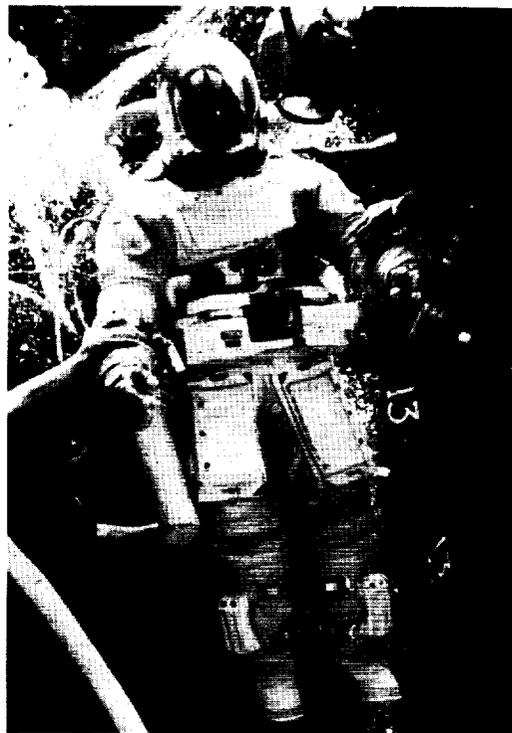

History

In April 1950, the United States Army established the Ordnance Guided Missile Center at Redstone Arsenal in Huntsville, Alabama. When in February 1956 the Army Ballistic Missile Agency (ABMA) was formed at the Redstone Arsenal, the Ordnance Guided Missile Center became ABMA's Development Operations Division. After the establishment of NASA in October 1958, President Dwight D. Eisenhower requested Congress to transfer the facilities and personnel involved in ABMA's space missions to NASA. In March 1960, the Development Operations Division was transferred to NASA and renamed the George C. Marshall Space Flight Center

in honor of General of the Army George C. Marshall, who had been Chief of Staff during World War II and Secretary of State from 1948 to 1949. (For a more detailed history of the Marshall Space Flight Center, see Chapter VI of *NASA Historical Data Book, I.*)

Mission

The primary mission of the Marshall Space Flight Center was to develop space transportation systems, orbital systems, and scientific payloads for space exploration. The center was responsible for the development of the Saturn launch vehicles used in the Apollo manned lunar-landing program, in the Skylab space station program, and in the joint Soviet-American Apollo-Soyuz Test Project. The center also was involved in the development of the solid-fueled rocket booster, the main engine, and the external tank for the Space Shuttle. In addition, the Marshall Space Flight Center managed and directed operations of its three component installations—the Michoud Assembly Facility near New Orleans, Louisiana; the Mississippi Test Facility (until June 1974, when it became the independent National Space Technology Laboratories) located in Bay St. Louis, Mississippi; and the Slidell Computer Complex in Slidell, Louisiana.

**NATIONAL SPACE
TECHNOLOGY
LABORATORIES**

PRECEDING PAGE BLANK NOT FILMED

The first series of tests on the Space Shuttle Main Propulsion Test Article were completed on this stand at the National Space Technology Laboratories located in Hancock County, Mississippi.

ORIGINAL PAGE
BLACK AND WHITE PHOTOGRAPH

NATIONAL SPACE TECHNOLOGY LABORATORIES

Location

The National Space Technology Laboratories was located approximately fifty-five miles northeast of New Orleans in Bay St. Louis, Mississippi.

Manager: Jackson M. Balch (June, 1974-)

History

The National Space Technology Laboratories, previously called the Mississippi Test Facility, became an independent NASA installation in June 1974. This change came as a consequence of a shift in emphasis in the national space program from manned exploration to include the exploration of the earth's natural resources and environment. (For a more detailed history of the Mississippi Test Facility, see Chapter VI of *NASA Historical Data Book, I.*)

Mission

Whereas the Mississippi Test Facility's main mission had been to test-fire Saturn rockets, the main task of the National Space Technology Laboratories was to provide NASA with the capabilities of conducting remote sensing, environmental, and related research. Also, NASA encouraged other NASA supporting activities that could complement research carried out at the National Space Technology Laboratories to move to the same location.

**SPACE NUCLEAR
PROPULSION OFFICE**

SPACE NUCLEAR PROPULSION OFFICE

Location

The Space Nuclear Propulsion Office was located in Germantown, Maryland.

Manager: Milton Klein (March 1967-)
Harold B. Finger (August 1960-March 1967)

History

In August 1960, the Atomic Energy Commission and NASA established a joint single project office responsible for all aspects of the nuclear rocket research program. In February 1961, another agreement between the two agencies led to the establishment of jointly staffed field extensions of the Space Nuclear Propulsion Office in Cleveland, Ohio, and Albuquerque, New Mexico. A third field facility, the Nuclear Rocket Development Station at Jackass Flats, Nevada, was placed under the supervision of the Space Nuclear Propulsion Office in February 1962. In June 1970, the Space Nuclear Propulsion Office was renamed the Space Nuclear Systems Office. It was disestablished in 1973. (For a more detailed history of the Space Nuclear Propulsion Office, see Chapter VI of *NASA Historical Data Book*, Vol. I.)

Mission

The mission of the Space Nuclear Propulsion Office was to supervise and conduct all research and testing necessary to develop nuclear rocket systems suitable for advanced space exploration. It also had management responsibility for ground static-testing of reactors, engines, and vehicles associated with nuclear rocket development at the Nuclear Rocket Development Station in Jackass Flats, Nevada.

WALLOPS STATION/FLIGHT CENTER

WALLOPS STATION/FLIGHT CENTER

Location

Wallops Station was located on Wallops Island, off the Delmarva Peninsula in Virginia and on an additional property nearby on the mainland. It was approximately fifty miles southeast of Salisbury, Maryland, and seventy miles north of the Chesapeake Bay Bridge Tunnel.

Director:

Robert L. Krieger (June 1948-)

Associate Director:

Abraham D. Spinak (August 1966-)

History

Wallops Island's association with NASA dates back to 1945, when NASA's predecessor organization, the National Advisory Committee for Aeronautics (NACA), established a test-launching facility for its Langley Memorial Aeronautical Laboratory on the island in May of that year and named it the Auxiliary Flight Research Station. In August 1946, the Wallops facility was placed under the Operations Section of the Pilotless Aircraft Research Division, a division of Langley's Research Department. The Wallops facility was renamed the Pilotless Aircraft Research Station, popularly known simply as Wallops. In May 1959, some seven months after NACA's absorption by NASA, the Wallops facility became an independent NASA installation called Wallops Station. In April 1974, Wallops Station was renamed the Wallops Flight Center, reflecting more closely its mission and operations. (For a more detailed history of Wallops Station, see Chapter VI of *NASA Historical Data Book*, Vol. I.)

Mission

Wallops Station has served primarily as NASA's rocket flight-test range. By 1974 alone, more than 8,000 launches, including many orbiting satellites, had been fired off from Wallops Station. Scientists and engineers from

PRECEDING PAGE BLANK NOT FILMED

379

PAGE 378 INTENTIONALLY BLANK

other NASA installations, other governmental agencies, colleges and universities, and the international scientific community throughout the world have participated in tracking and acquiring scientific information from space vehicles launched from Wallops Island. Wallops Station exercised project management responsibility over such NASA projects as GEOS C, the Experimental Inter-American Meteorological Rocket Network, the Polar Cusp, the operation of remote site launching and tracking facilities, and the operation of NASA's portable range facilities.

JET PROPULSION LABORATORY

PRECEDING PAGE BLANK NOT FILMED

PAGE 384 INTENTIONALLY BLANK

The Jet Propulsion Laboratory is a Government-owned facility at the California Institute of Technology in Pasadena, Ca. The Laboratory, which is under a NASA contract, is staffed and managed by the California Institute of Technology.

ORIGINAL PAGE
BLACK AND WHITE PHOTOGRAPH

JET PROPULSION LABORATORY

Location

The Jet Propulsion Laboratory was located in Pasadena, California, approximately twenty miles northeast of Los Angeles.

Director:

Bruce C. Murray (April 1976-)
William H. Pickering (September 1954-March 1976)
L. G. Dunn (1947-1954)
F. J. Malina (1944-1946)

Deputy Director:

C. H. Terhune, Jr. (July 1971-)
John E. Clark (February 1968-July 1971)
A. R. Luedecke (August 1964-August 1967)
B. O. Sparks (February 1960-July 1964)

History

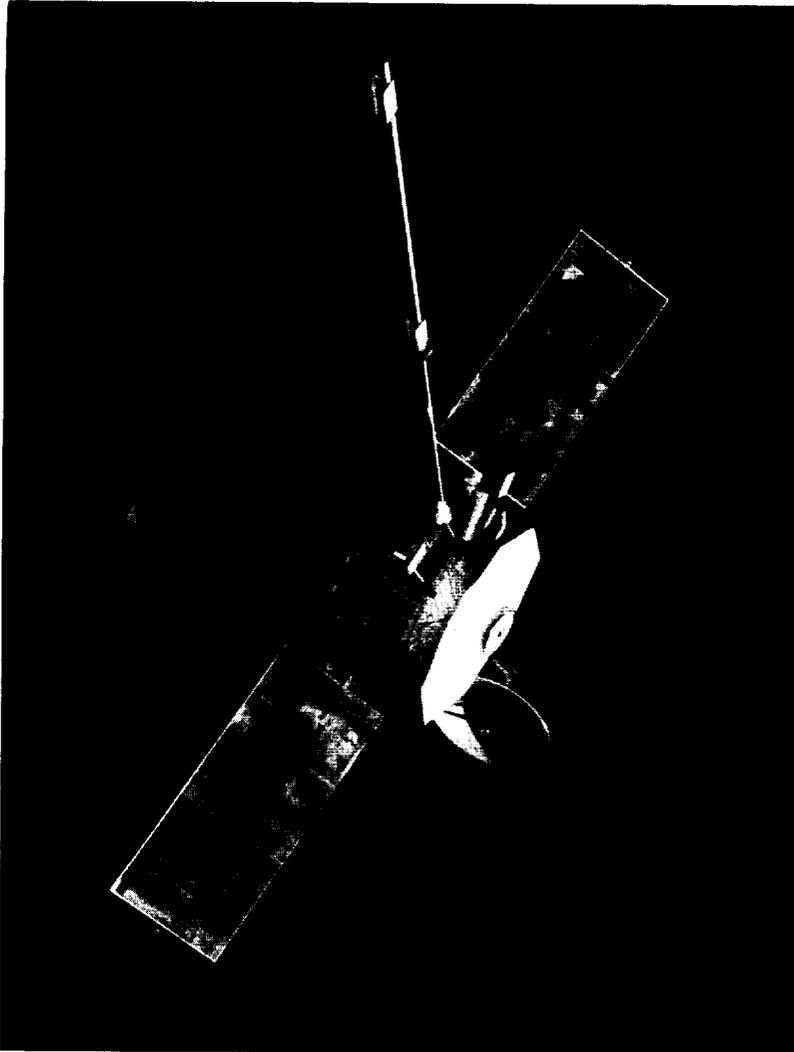

The Jet Propulsion Laboratory was a Government-owned facility staffed and managed by the California Institute of Technology in Pasadena, California. In 1936 faculty and students began design and experimental work with liquid-propellant rocket engines at the Guggenheim Aeronautical Laboratory of the California Institute of Technology (GALCIT).

In June 1940, the Army awarded GALCIT a contract to develop solid- and liquid-propellant rocket engines. This program, called the GALCIT Rocket Research Project, continued for the duration of World War II. In the postwar period, the facility, renamed the Jet Propulsion Laboratory in 1944, conducted research and development for the United States Army on tactical guided missiles and aerodynamics. In 1958, shortly after NASA was established, the Jet Propulsion Laboratory was transferred from the Army to NASA. It retained its special position as a laboratory of the California Institute of Technology under contract to NASA. (For a more

detailed history of the Jet Propulsion Laboratory, see Chapter VI of *NASA Historical Data Book*, Vol. I.)

Mission

The Jet Propulsion Laboratory has engaged in research associated with such activities as deep-space automated scientific missions, tracking, data acquisition, development of advanced solid- and liquid-propellant spacecraft engines, and development of advanced spacecraft guidance and control systems. It has managed projects in NASA's unmanned lunar and planetary exploration programs and has operated worldwide deep-space tracking and data acquisition networks.

A Mariner Venus Mercury "73" spacecraft designed for a 1973 mission to Venus and Mercury built by the Boeing Company under project management of Jet Propulsion Laboratory.

Distinguished Service Medal

The NASA Distinguished Service Medal, NASA's highest award, is given to any person in Federal service who, "by distinguished service, ability, or courage, has personally made a contribution representing substantial progress to aeronautical or space exploration in the interests of the United States." Recommendations for this award are reviewed by the NASA Incentive Awards Board.

Distinguished Public Service Medal

The NASA Distinguished Public Service Medal is granted only to individuals whose meritorious contributions produced results which measurably improved, expedited, or clarified administrative procedures, scientific progress, work methods, manufacturing techniques, personnel practices, public information services, and other efforts related to the accomplishment of the mission of NASA. It is granted to any United States citizen who is not an employee of the Federal Government or was not an employee during the period in which the service was performed.

Public Service Group Achievement Award

The NASA Public Service Group Achievement Award is presented in recognition of a meritorious achievement which does not fall within the scope of other NASA awards. It is granted to a group for an outstanding contribution or achievement which is sufficiently above normal work standards to warrant special recognition or which has resulted in specifically identifiable or monetary benefits to the government.

- Acts Computing Corp.: 216, 224
Addison, TX: 202
Administrator, NASA: 154
Advanced Research and Technology, (NASA HQ) Office of: 15, 17, 18, 25; total investment value of facilities, 26-31
Aerojet-General Corp.: 183, 184, 188, 192, 196, 201, 205, 219, 224
Aeronautics and Space Technology, (NASA HQ) Office of: 25; budgets, 144, 145, 146, 147; total investment value of facilities, 26-31
Aeronutronics Ford Corp.: 209, 213
Aerospace Awards: 393-425
Aerospace Corp.: 235, 239, 243, 248, 252, 256, 261, 265
Aero Spacelines, Inc.: 185, 190, 194, 202
Agnew, Spiro T.: 3
Air Products and Chemicals, Inc.: 182, 185, 190, 194, 198, 202, 207, 211, 214, 221
Akron, OH: 187, 191
Alabama, University of: 229, 230, 233, 234, 236, 238, 240, 245, 250, 253, 255, 257, 261, 266
Alameda, CA: 223
Alaska, University of: 228, 237, 240, 244, 250, 255, 263, 267
Albany Medical College: 234
Albany, NY: 233, 234, 236, 240, 244, 250, 251, 254, 258, 262, 266, 267
Albuquerque, NM: 228, 233, 236, 241, 242, 245, 250, 251, 254, 258, 262, 267
Aldrin, Edin A.: 82
Algernon Blair, Inc.: 218, 224
Allentown, PA: 185, 190, 194, 214, 218, 221
Allied Engineering and Production Corp.: 223
Allis-Chalmers Mfg. Co.: 186, 191
Alpha Building Corp.: 202, 206, 212, 216, 220
Amdahl Corp.: 216
American Airlines, Inc.: 204
American Indians: (*See also* Minorities; Personnel) 65, 98, 99, 101, 100, 101, 102, 103
American Institute of Aeronautics and Astronautics: 225, 227, 231, 236, 240, 244, 249, 253, 257, 261, 265
American Institute of Biological Sciences: 234, 238, 242, 251, 266
American Science and Engineering, Inc.: 185, 189, 193, 197, 201, 205, 209, 213, 218, 223
American Society for Public Administration: 229
American Telephone and Telegraph: 185, 189, 194, 198, 201, 206, 211
Ames Research Center: 15, 18, 20, 25, 275, 276, 277, 278; budgets, 141, 142, 143; buildings on, 35; buildings, square footage, 36; buildings value, 41-42, 46, 47; capitalized equipment value, 43, 48; clerical employees, 91, 92, 97; contractor-held buildings, 37-38, 53-56; contractor-held real property value, 49, 50; engineering employees, 85, 86, 87, 93; excepted service employees, 81, 83; installation information, 291-96; land owned, 33; land value, 40, 45; military employees, 84; minorities, 102, 103; paid employees, 76-78, 85-92; permanent employees, 74-75, 79, 93-95, 97, 102; personnel with professional degrees, 74, 75; P.L. 313 employees, 81, 83; professional administrative employees, 91, 92, 97; real property value, 39, 48; scientific employees, 85, 86, 87, 93; supergrade employees, 81, 83; technical support employees, 88, 94; temporary employees, 80; trades and labor employees, 89, 90, 95; total investment value of facilities, 26-31; women, 107, 108; value of contract awards, 179, 180
Amex Corp.: 206

- Amherst, MA: 230, 233, 238, 242, 246, 251
 Ampex Corp.: 186, 189, 194, 199, 202, 216, 220, 223
 Amplex Corp.: 211
 Anaheim, CA: 210, 211, 215, 220
 Andover, ME: 185, 189
 Ann Arbor, MI: 225, 227, 231, 235, 239, 242, 243, 248, 252, 253, 256, 257, 260, 261, 264, 265
 Apollo: 145, 247
 Apollo 11: 3, 82, 96
 Apollo 17: 4, 129
 Apollo Command Module: 5, 6, 139
 Apollo Service Module: 5
 Apollo-Soyuz Test Project: 5, 6, 139
 Appropriations: (*See also* Authorizations, financial; Budgets) 116, 120, 121, 122, 123, 124, 125, 126, 127, 128, 130, 131, 132, 133, 134, 135, 136, 137, 138, 140
 Arcata, CA: 263, 267
 Arizona State University: 259, 263, 266
 Arizona, University of: 228, 232, 236, 239, 243, 248, 252, 256, 260, 264
 Arlington, VA: 186, 190
 Armstrong, Neil A.: 82
 ARO, Inc.: 199, 207, 212, 216, 220, 224
 Asians: (*See also* Personnel) 65, 98, 99, 101, 100, 101, 102, 103
 Associate Deputy Administrator: 154
 Astronauts: 4, 5, 82
 Athens, GA: 229, 238, 246, 259
 Atlanta, GA: 207, 228, 230, 232, 234, 237, 241, 245, 249, 251, 253, 258, 261, 265
 Atlas Launch Vehicle: 158, 182
 Atomic Energy Commission: 275, 276, 277, 278
 Auburn, AL: 230, 233, 237, 241, 246, 250, 254

THE AUTHORS

Ihor Y. Gawdiak, a senior research analyst at the Library of Congress Federal Research Division, has done extensive research and written numerous government studies on Soviet and East European political and military topics. Since the demise of the Soviet Union, he has continued to research and write primarily on political and military developments in the newly independent states. He is the author of the "Nationalities and Religions" chapter in *Soviet Union: A Country Study* and editor of *Czechoslovakia: A Country Study*, both published by the Department of the Army as part of its Country Studies/Area Handbook Program. He is also the editor of *Ukraine: A Country Study*, which is scheduled for publication in 1994. Mr. Gawdiak received his B.A. and M.A. degrees in International Relations from Clark University in Worcester, Massachusetts. He has completed all course requirements in the doctoral program in Russian History at the University of Maryland.

Helen Fedor, a senior research analyst at the Library of Congress' Federal Research Division, is the author of many foreign-language abstracts, mostly on industrial subjects. She was the co-author of the "Society and Its Environment" chapter in *Czechoslovakia: A Country Study*, published by the Department of the Army as part of its *Area Handbook Series*. She is currently the editor of *Moldova: A Country Study* and *Belarus: A Country Study* in the same series; both are scheduled for publication in 1994. Ms. Fedor received her B.A. degree from the University of Chicago.

- Astronautics and Aeronautics, 1975: Chronology of Science, Technology, and Policy.* (NASA SP-4020, 1979).
- Astronautics and Aeronautics, 1976: Chronology of Science, Technology, and Policy.* (NASA SP-4021, 1984).
- Astronautics and Aeronautics, 1977: Chronology of Science, Technology, and Policy.* (NASA SP-4022, 1986).
- Astronautics and Aeronautics, 1978: Chronology of Science, Technology, and Policy.* (NASA SP-4023, 1986).
- Astronautics and Aeronautics, 1979–1984: Chronology of Science, Technology, and Policy.* (NASA SP-4024, 1988).
- Astronautics and Aeronautics, 1985: Chronology of Science, Technology, and Policy.* (NASA SP-4025, 1990).

Management Histories, NASA SP-4100:

- Rosholt, Robert L. *An Administrative History of NASA, 1958–1963.* (NASA SP-4101, 1966).
- Levine, Arnold S. *Managing NASA in the Apollo Era.* (NASA SP-4102, 1982).
- Roland, Alex. *Model Research: The National Advisory Committee for Aeronautics, 1915–1958.* (NASA SP-4103, 1985).
- Fries, Sylvia D. *NASA Engineers and the Age of Apollo* (NASA SP-4104, 1992).
- Glennan, T. Keith. *The Birth of NASA: The Diary of T. Keith Glennan,* edited by J.D. Hunley. (NASA SP-4105, 1993).

Project Histories, NASA SP-4200:

- Swenson, Loyd S., Jr., Grimwood, James M., and Alexander, Charles C. *This New Ocean: A History of Project Mercury.* (NASA SP-4201, 1966).
- Green, Constance McL., and Lomask, Milton. *Vanguard: A History.* (NASA SP-4202, 1970; rep. ed. Smithsonian Institution Press, 1971).
- Hacker, Barton C., and Grimwood, James M. *On Shoulders of Titans: A History of Project Gemini.* (NASA SP-4203, 1977).
- Benson, Charles D. and Faherty, William Barnaby. *Moonport: A History of Apollo Launch Facilities and Operations.* (NASA SP-4204, 1978).

- Brooks, Courtney G., Grimwood, James M., and Swenson, Loyd S., Jr. *Chariots for Apollo: A History of Manned Lunar Spacecraft*. (NASA SP-4205, 1979).
- Bilstein, Roger E. *Stages to Saturn: A Technological History of the Apollo/Saturn Launch Vehicles*. (NASA SP-4206, 1980).
- Compton, W. David, and Benson, Charles D. *Living and Working in Space: A History of Skylab*. (NASA SP-4208, 1983).
- Ezell, Edward Clinton, and Ezell, Linda Neuman. *The Partnership: A History of the Apollo-Soyuz Test Project*. (NASA SP-4209, 1978).
- Hall, R. Cargill. *Lunar Impact: A History of Project Ranger*. (NASA SP-4210, 1977).
- Newell, Homer E. *Beyond the Atmosphere: Early Years of Space Science*. (NASA SP-4211, 1980).
- Ezell, Edward Clinton, and Ezell, Linda Neuman. *On Mars: Exploration of the Red Planet, 1958–1978*. (NASA SP-4212, 1984).
- Pitts, John A. *The Human Factor: Biomedicine in the Manned Space Program to 1980*. (NASA SP-4213, 1985).
- Compton, W. David. *Where No Man Has Gone Before: A History of Apollo Lunar Exploration Missions*. (NASA SP-4214, 1989).
- Naugle, John E. *First Among Equals: The Selection of NASA Space Science Experiments* (NASA SP-4215, 1991).

Center Histories, NASA SP-4300:

- Rosenthal, Alfred. *Venture into Space: Early Years of Goddard Space Flight Center*. (NASA SP-4301, 1985).
- Hartman, Edwin P. *Adventures in Research: A History of Ames Research Center, 1940–1965*. (NASA SP-4302, 1970).
- Hallion, Richard P. *On the Frontier: Flight Research at Dryden, 1946–1981*. (NASA SP-4303, 1984).
- Muenger, Elizabeth A. *Searching the Horizon: A History of Ames Research Center, 1940–1976*. (NASA SP-4304, 1985).
- Hansen, James R. *Engineer in Charge: A History of the Langley Aeronautical Laboratory, 1917–1958*. (NASA SP-4305, 1987).
- Dawson, Virginia P. *Engines and Innovation: Lewis Laboratory and American Propulsion Technology*. (NASA SP-4306, 1991).
- Dethloff, Henry C. *“Suddenly Tomorrow Came . . .”: A History of the Johnson Space Center, 1957–1990*. (NASA SP-4307, 1993).

General Histories, NASA SP-4400:

- Corliss, William R. *NASA Sounding Rockets, 1958–1968: A Historical Summary*. (NASA SP-4401, 1971).
- Wells, Helen T., Whiteley, Susan H., and Karegeannes, Carrie. *Origins of NASA Names*. (NASA SP-4402, 1976).
- Anderson, Frank W., Jr., *Orders of Magnitude: A History of NACA and NASA, 1915–1980*. (NASA SP-4403, 1981).

- Sloop, John L. *Liquid Hydrogen as a Propulsion Fuel, 1945-1959*. (NASA SP-4404, 1978).
- Roland, Alex. *A Spacefaring People: Perspectives on Early Spaceflight*. (NASA SP-4405, 1985).
- Bilstein, Roger E. *Orders of Magnitude: A History of the NACA and NASA, 1915-1990*. (NASA SP-4406, 1989).

New Series in NASA History, published by The Johns Hopkins University Press:

- Cooper, Henry S. F., Jr. *Before Lift-Off: The Making of a Space Shuttle Crew*. (1987).
- McCurdy, Howard E. *The Space Station Decision: Incremental Politics and Technological Choice*. (1990).
- Hufbauer, Karl. *Exploring the Sun: Solar Science Since Galileo*. (1991).
- McCurdy, Howard E. *Inside NASA: High Technology and Organizational Change in the U.S. Space Program*. (1993).
